Harrison and Sharp's "Beowulf" - Ginn and Co., Boston, 1895.

mass of each of these by a numerous
 multitude of students of varying reputation and
 German scholarship, it would be a herculean task to
 unravel the thread of truth from this perplexing tangle
 of conflicting theories. Happily we are not
 faced with the facts and that which
 interest at the mercy of the theorist in the deter-
 mining the principles of Anglo-Saxon versification
 we have the test of the actual facts to which we can subject
 the theory which best accords with the facts
 covered in an article entitled "Our
 Germanischen."

The Ryth Rhythmik ^{Germanischen} Alliterationsverses" (1887) which appeared in Volumes X⁽¹⁸⁸⁵⁾ and XII[^] of Paul and Braune's "Beiträge zur Deutschen ^{Sprache} und Literatur", ~~in 1889~~; and also in his "Altgermanische Metrik", published in 1893. This theory, with slight modifications in perhaps not very important particulars, is that which has been adopted in this discussion.

It is unnecessary to repeat in this chapter what has already been ^{fully said in Chap.} ~~said~~ of the historical connection of Anglo-Saxon poetry with later English poetry. The connection is direct and essential. The same ^{fundamental} ~~principles~~ principles - the principle of accentuation for marking the feet without

* - which ~~it~~ explains all the phenomena
is, ^{in our opinion,} that promulgated by Prof. Eduard
Sievers

regard ^(within certain limitations) to a ~~fixed~~ ^{fixed} number of syllables - oper-
ates in both; though, of course, ^{not under} ~~with~~ exactly the same restrictions. Prof.
Sweet says that the fact that the word-
stress as well as the sentence-stress is
rigorously observed, "proves that Old
English poetry must have been recited
not sung". While this is true it must
not be forgotten that the ^{recitation} ~~was~~ ^{was} a rhythmic
recitation, frequently accompa-
ned by some musical instrument; that,
as is the case with all rude peoples,
they emphasized the rhythm, at ^{the} expense
of the sense, if need be. The frequent
occurrence of alliteration, marking
the rhythmic periods, is additional evidence
of the importance they attached to the
rhythm. Some of their prose even, approach-
es the rhythm of modern poetry.
The relation of the rhythm of Anglo-Saxon poetry
to the rhythm of modern English poetry might
be compared to the relation of the rhythm of
our modern prose to that of the Anglo-Saxons.

word ^{is} to a ^{the} fixed number of syllables - oper-
ates ~~in~~ in both; though, of course, ^{not under} ~~with~~
~~at~~ exactly the same restrictions. Prof.
Sweet says that the fact that the word-
stress as well as the sentence-stress is
rigorously observed, "proves that Old
English poetry must have been recited
not sung". While this is true it must
not be forgotten that ~~there~~ ^{recitation} was a rhythm-
ical recitation, frequently accompa-
nied by some musical instrument; that,
as is the case with all rude people,
they emphasized the rhythm, at ^{the} expense
of the sense, if need be. The frequent
recurrence of alliteration, marking
the rhythmic periods, is additional evidence
of the importance they attached to the
rhythm. Some of their phrase even, approach
the rhythm of modern poetry.

The relation of the rhythm of Anglo-Saxon poetry
to ~~the rhythm of modern English poetry~~ ^{the rhythm of modern English poetry} might
be compared to the relation of the rhythm of
our nursery rhymes and folk songs to
the rhythm of the poetry of Tennyson or Milton.
Hence, if we can ~~study~~ ^{profitably study}

* (put at bottom of page, as footnote) Lamer
is authority for the statement that ~~he~~
~~says as quoted by Lamer, I have been~~
~~syrrhivitt "could see no rhythm at all in Anglo~~
~~saxon poetry, nor even its alliteration."~~
~~unable to perceive any rhythm at all - even~~

3. 2.
takes the position that there is not to be found "the slightest trace of temporal rhythm" in the Anglo Saxon poems. Prof. Liches thought that Anglo Saxon verse was governed by the laws of classical quantity. Prof. Sweet says (from the principle in his "Anglo Saxon Reader" that view in the introduction to his Anglo Saxon reader) the essential elements of Old English are accent and alliteration. * * *

The "number of ~~unaccented~~ syllables is different as the verse is not made too light on the one hand, or overloaded on the other hand". *
and laws of ^{modern} i.e. S. versification as operate in English prosody, and emphasizes the fact that Anglo Saxon rhythm is well as all rhythm is based upon musical principles.

Among the German scholars (and they are given the most attention to this subject) we have the "Confusion worse confounded". With the Achmann and Müllenhoff, and others, with the theory of Möller, Franke and others, and their many followers, and the multitude of variations and modifications.

* This theory ^{is} ~~has been~~ opposed by Laurence
in his "Lectures on Alliterative Verse", and
Heath in his "The Old English Alliterative
Line".

~~Amey~~

(1)
Anglo Saxon metre from the standpoint of ^{modern} English versification we can not less profitably study English versification in the light of Anglo Saxon ^{poetry} metre. Of the entire body of Anglo Saxon literature, ~~about~~ ^{some} thirty thousand lines, in round numbers, have been preserved to us.* What proportion of the original amount was entirely lost is a matter of conjecture. While it must have been considerable, yet it is very probably ~~that~~ the remains we have are fairly representative of the whole.

The most important and the ~~most~~ ^{longest} poetic of the Anglo Saxon poems is the Beowulf. It is ~~epic in character~~ and contains 183 lines. The other most considerable poems in length are: Genesis 2935 lines; Andreas 1720; Crist 1694; Elene 1353; Juliana 731; Daniel 465; Juliana 731; Phoenix 677; Exodus 589; and Salomo and Saturn 504. In addition to these, there are a number of shorter poems, varying in length from ~~five~~ three or four hundred to a few lines, and some of these shorter poems ^{however} have more poetic excellence than the larger ones.

The best edition - a complete one - of the Anglo Saxon poems is the "Anglo Saxon Poems" by Mr. Bosworth.

~~we can not less properly~~
~~apply English versification in the light of Anglo-Saxon~~
of the entire body of Anglo-Saxon literature, ~~some~~ ^{about} thirty thousand lines, in round numbers, have been preserved to us.* What proportion of the original amount is entirely lost is a matter of conjecture. While it must have been considerable, yet it is very probably ~~that~~ the remains we have are fairly representative of the whole.

The most important and the ~~most~~ ^{longest} poetic of the Anglo-Saxon poems is the Beowulf. It is ~~epic in character, and~~ contains 183 lines. The other most considerable poems in length are: Genesis 2935 lines; Andreas 1720; Crist 1694; Elene 1353; ~~Juliana 731~~; ~~Gene 1320~~; Daniel 765; Juliana 731; Phoenix 677; Exodus 589; and Salomo and Saturn 504. In addition to these, there are a number of shorter poems, varying in length from ~~one~~ three or four hundred to a few lines, ~~and~~ some of these shorter poems ^{however} have more poetic excellence than the larger ones.

The best edition - a complete one - of the Anglo-Saxon poetry (at the present) is Grein-Wülker's "Bibliothek der alt-sächsischen Poesie", Hassell, 1888.

~~Anglo Saxon poetry~~
~~These poems~~, covers a period of
one ~~three~~ or four centuries — ^{perhaps} from
~~about the middle of the~~ 7th ^{century} to the ^{middle of the} 11th. ^{However, the} dates of many
of the earlier ~~poems~~ are conjectural, and
can not be fixed with ~~exactness~~ ^{certainty}. It is not
improbable, indeed, inasmuch as the poems
were handed down ^{for a long time in} by the memory of men,
that some of these, such as Widsith, the charms,
the lays in Beowulf, etc., were composed at a
much earlier date than the 7th century; ^{perhaps}
perhaps before the ^{Anglo-Saxons} Angles, Jutes and Saxons
came over from the Continent.

Although composed at widely different
periods, nearly all of the ~~Anglo-Saxon~~
poems ~~are~~ have been transmitted in
manuscripts of the 10th and 11th centuries;
~~and although~~ and that, too, by ~~Anglo-Saxon~~ ^{West} Saxon
scribes, and, ^{to a great extent, West} in the Saxon dialect ^{to a}
~~great extent~~ although all ^{except the few} ~~the latest~~
~~poems and a few other minor poems~~ ^{poems} of them were composed, ^{in all probability,}
in English dialect. The most important of those
transmitted in other than the West Saxon dialect
are: Caedmon's Hymn, the Ruthwell Cross, Bede's
Death Speech, and the Leyden Riddle, in the

Northumbrian dialect; Psalm 50, and Hymn II
in the Kentish.

Metrically considered, however, this
transmission of the poems in a dialect
different from that in which they were
composed, and at a later date, is of
so very great importance. The main
metrical types are the same in all three
dialects, ^{they are,} as, indeed, in all the Teutonic
languages ^{of} that period. The chief difference
is that the West Saxon dialect, ^{frequently} ~~has~~ ^{into} fre-
quently shortened and contracted inflec-
tion endings, where the Anglian, in all
probability, had only the longer and uncon-
tracted forms. Inasmuch as these inflec-
tion endings are always short and
unaccented, they have little effect on the
rhythm, and it is perhaps better to disre-
gard them altogether, except in ~~such~~ those cases
where a substitution of the Anglian form (if
it can be determined with certainty) will
give a more common verse-type. For met-
rical purposes, the West Saxon dialect
is as complete as any other, and it

~~no~~ illustrates equally clearly the funda-
mental principles of Anglo Saxon versifi-
cation. Besides, it gives us the poems
at a time when both the language and
the metre had attained a more advanced
^{stage of ~~culture~~ ^{and} culture} and a higher degree of polish,
~~and it~~ ^{and it} seems that there is little to be gained,
~~from the metrical standpoint at least,~~
~~in~~ attempting to reduce the poems
again to their original ^{form.} ~~Anglian dialect.~~

The accents

In Anglo Saxon, as in modern
English, there are three kinds of ac-
cents: word accent, sentence accent,
and metrical accent.

Word accent, or etymological accent,
as it is sometimes called,
^{as has already been stated,}
Anglo Saxon, just as modern Eng-
lish versification, is based on accent,
and not on quantity, in the classic
case. It is true that here also, ~~just~~
as in ~~old~~ modern English, ~~that~~ all sounds
necessarily have some "quantity", but this
quantity is variable even in the same line,

5. 7. the syllable
and depends ^{for its quantity} on the case with which it can be
uttered, and the number of syllables which ^{by which}
it is accompanied. ^{is connected in the same measure}
quantity, rather than ^{on the} by the nature
of its vowel as "long" or "short", or as
followed by two consonants or a single
consonant.

Anglo Saxon in like manner, ^{as the modern English,} differs
from Latin and Greek, and agrees
with modern English, in the nature of its
accents. We have here ^{also,} the
tree as in ^{in the latter modern English} ~~modern English~~ three
kinds of accent: word accent, sentence
accent, and rhythmic accent; and
the definition ^{of} for these ~~are~~ given in
chapter I here again holds good. Word
accent is the stress of voice laid on
one syllable of a word of more than
two syllables, to indicate its ~~superior~~
preeminence ^{of syllables} over the other ~~words~~
of the word. Monosyllables, for metri-
cal purposes, may be regarded either
as accented or unaccented, as the metre

...the number of syllables ^{by which} ~~is accompanied~~ ^{is connected} in the ~~same~~ ^{measure} ~~type~~ ^{for its} quantity, rather than ^{on the} ~~by the~~ ^{on the} ~~na-~~ ^{ture} of its vowel as "long" or "short", or ~~as~~ ^{on the number of} ~~followed by two consonants or a single~~ ^{consonant} ~~consonant~~.

Anglo Saxon in like manner ^{as the modern English,} differs from Latin and Greek, ~~and agrees~~ ^{with modern English,} in the nature of its accents. We have here ^{also,} ~~again~~ the ~~same~~ ^{in the latter, modern English} ~~three~~ ^{three} kinds of accent: Word accent, sentence accent, and rhythmic accent; and the definition ^{of} ~~for~~ these ~~are~~ ^{are} given in Chapter I here again holds good. Word accent is the stress of voice laid on one syllable of a word of more than two syllables, to indicate its ~~superior~~ ^{preeminence} ~~of~~ ^{over} the other ~~words~~ ^{syllables} of the word. Monosyllables, for metrical purposes, may be regarded either as accented or unaccented as the metre ^{requires} ~~requires~~. * (over)

Compound words which ^{regularly} have a secondary
accent ^{in prose,} may retain that accent in poetry
where it does not interfere with the rhythm.
In case rhythmical accents fall on
both the primary and secondary ^{word}
accents, ~~the~~ which sometimes occurs -
~~in the syllable of the~~
the secondary accent receives like-
wise the full stress of the rhythmical
accent, ~~and in this respect is~~
~~and is~~ not distinguished
from the primary accent syllable.

The secondary accent of compound
varies in intensity with the relative im-
portance of each component part, and
the nature of their relation to each other.
As to whether a secondary accent is to be
recognized in the ^{versification} ~~poetry~~, will depend per-
haps, more on the requirement of the rhythm
in each particular case. This view is
^{reinforced} ~~supported~~ by the fact that even in prose
it is undecided ~~whether~~ in many cases whether
the compound should be pronounced with
a secondary accent. * (on back of next page -
109. but here.)
For metrical purposes, the word acc-

accent in prose,
may retain that accent in poetry
where it does not interfere with the rhythm.
In case rhythmical accents fall on
both the primary and secondary ^{words}
accents, ~~the~~ which sometimes occurs -
~~the syllable of the~~ secondary accent receives like-
wise the full stress of the rhythmical
accent, ~~and is in this respect~~ ^{and is in this respect} is
not distinguished
from the primary accent syllable.

The secondary accent of compound
varies in intensity with the relative im-
portance of each component part, and
the nature of their relation to each other.
As to whether a secondary accent is to be
recognized in the ^{verisignature} ~~poetry~~, will depend per-
haps, more on the requirement of the rhythm
in each particular case. This view is
^{reinforced} ~~supported~~ by the fact that even in prose
it is undecided ~~whether~~ in many cases whether
the compound should be pronounced with
a secondary accent. * (on back of next page -
104. but here.)

For metrical purposes, the word accented
even
of words of more than one syllable is ob-
scured, unless it coincides with a metrical ac-

8. 10.
The sentence accent is the stress (greater than that of the word accent) laid ~~on~~ ^{"thought"} on a word in a clause, or ~~logical~~ ^{syntactical} unit to indicate its preeminence over the other words of the clause. ~~Then~~ ^{accompanying this in} stress varies ~~in~~ ^{usually a change} degree ~~with~~ ^{as well} according to the logical ~~importance~~ ^{relative importance} of the word in which it falls. The ~~logical~~ ^{sentence} accent regularly coincides with the word accent, except ^{in such cases as} where ^{possibly} for the purpose of contrast it falls on the usually unaccented prefix of two antithetical words, etc. The sentence accent, ^{as has been said,} ~~too, too, usually~~ ^{regularly} falls on the most important words of the sentence; ^{that is,} ~~that that is, of course,~~ upon any word that is made for the time being the logical subject ~~of the sentence~~. Usually this is a substantive, ^{although} ~~but~~ it may be an adverb, a preposition, or some ^{similar part of speech} ~~other part of speech~~. The metrical accent is a stress of voice laid upon syllables or words.

(add to star on back of page 5)

* There are some words - such as
primitisendra^{afterisendra}, etc - which some would
consider as having three word accents -
one on the first, second and third
syllables, respectively. In this case, the
first and second accents would coincide
with the metrical accents, and be primary
accents in effect, while the ~~the~~ third would
have only the force of a secondary accent
and perform the function ^{explained} ~~mentioned~~
under "type D" ~~below~~.
below page -

which are to be separated from each other by approximately equal intervals in pronunciation. The metrical accent divides the line into feet, or measures. In fact, here, as in Modern English, a foot may be defined as a number of syllables ~~or words~~ marked off by a metrical accent; and each line contains as many feet as it has metrical accents. The metrical accent is of stress entirely, and is not accompanied by any variation in pitch. The metrical accent must coincide with the word and sentence accents. In Modern English, with its greater number of feet to the line, it sometimes occurs that a metrical accent falls on a word that has little or no word accent or sentence accent, but this is very rarely the case in Anglo Saxon.

As stated above,
The Anglo Saxon rhythm differs essentially very little from Modern English rhythm. As has been shown in Chapter I, poetic rhythm depends on the

regular recurrence of stress at ^{approximately} equal
 intervals of time. This interval of time
 occupied usually by the same num-
 ber of syllables in Modern English - "sub-
 stituted ~~feet~~" ^{by a different number of syllables}
^{permitted of course, wherever they may be required}
~~of comparable rare - but this is not the~~
^(No. 11) ~~case in~~ Engl Saxm, ^{however,} ~~the~~ where the num-
 ber of syllables constantly varies; and
 even the order of the accents changes con-
 stantly - always, ^{of course,} within certain definite
 limits. ~~however.~~ Where there is a greater
 number of unaccented syllables in the
 foot than the normal, the ^{enunciation} articulation
 is accelerated. Where there are fewer,
 it is retarded. The very nature
 of rhythm requires, ^{as we have seen in Chapter} that the ear be
 able to apprehend and coordinate reg-
 ularly ^{recurring} groups of sounds, ~~each~~ covering
 at least approximately equal inter-
 vals of time.

In ^{modern} English the order of the stresses
 in

~~It~~ this 4. 13.

Saxm ~~that~~ is most ~~commonly~~ frequently the case, but ~~not always~~. There are very many lines in which the accents come in juxtaposition. ~~Here the~~ In such cases the coordination of the groups of syllables is assisted by pauses, and by alliteration.

The rhythmic unit in Anglo-Saxm poetry is the line*. This is divided into two half-lines, which are separated from each other by a logical and rhythmic pause, called the caesura* (over

~~The line~~, and not the half-line is $1\frac{1}{2}$ the rhythmic unit, because ~~the~~ regularly the half-line is ~~incomplete~~ rhythmically, ~~as it were,~~ ~~the~~ rhythm is suspended; awaiting ~~as it were~~ at the close of the first half, ~~in the second~~ ~~it~~ ~~is~~ ~~complementary~~ ~~response~~ ~~they~~ ~~also~~ ~~always~~ ~~formed~~ ~~together~~ ~~into~~ ~~a~~ ~~rhythmic~~ ~~group~~ ~~by~~ ~~alliteration~~ ~~the~~ ~~constant~~ ~~variation~~ ~~of~~ ~~the~~ ~~position~~ ~~of~~ ~~the~~ ~~caesura~~ ~~in~~ ~~each~~ ~~half-line~~ ~~presents~~ ~~the~~ ~~tiresome~~ ~~monotony~~ ~~which~~ ~~is~~ ~~found~~ ~~in~~ ~~modern~~ ~~English~~ ~~poetry~~ ~~if~~ ~~the~~ ~~position~~ ~~of~~ ~~the~~ ~~caesura~~ ~~is~~ ~~not~~ ~~varied~~ ~~in~~ ~~each~~ ~~line~~ ~~of~~ ~~poetry~~ ~~Anglo~~ ~~Saxm~~ ~~poetry~~ ~~contains~~ ~~four~~ ~~feet~~ ~~two~~ ~~in~~ ~~each~~ ~~half-line~~ ~~at~~ ~~least~~ ~~small~~

complementary response. They ~~also~~ ~~always~~ ~~formed~~ ~~together~~ ~~into~~ ~~a~~ ~~rhythmic~~ ~~group~~ ~~by~~ ~~alliteration~~ ~~the~~ ~~constant~~ ~~variation~~ ~~of~~ ~~the~~ ~~position~~ ~~of~~ ~~the~~ ~~caesura~~ ~~in~~ ~~each~~ ~~half-line~~ ~~presents~~ ~~the~~ ~~tiresome~~ ~~monotony~~ ~~which~~ ~~is~~ ~~found~~ ~~in~~ ~~modern~~ ~~English~~ ~~poetry~~ ~~if~~ ~~the~~ ~~position~~ ~~of~~ ~~the~~ ~~caesura~~ ~~is~~ ~~not~~ ~~varied~~ ~~in~~ ~~each~~ ~~line~~ ~~of~~ ~~poetry~~ ~~Anglo~~ ~~Saxm~~ ~~poetry~~ ~~contains~~ ~~four~~ ~~feet~~ ~~two~~ ~~in~~ ~~each~~ ~~half-line~~ ~~at~~ ~~least~~ ~~small~~

form ~~that~~ is most ^{frequently} ~~commonly~~ the
case, but ~~not always~~. There are very
many lines in which the accents
come in juxtaposition. ^{In such cases the}
~~coordination of the groups of groups is assisted~~
~~division into feet is performed by pauses~~
~~and by pauses, and by alliteration~~

The rhythmic unit in Anglo-Sax-
on poetry is the line*. This is divided
into two half-lines, which are separated
from each other by a logical and
rhythmic pause, called the caesura* (over

~~The line~~, and not the half-line is ^{the} rhythmic unit, because ^{regularly}
of the half-line is ^{rhythmically} ~~incomplete~~ ^{in itself};
the rhythm is ^{as it were, a} suspended; awaiting ^{as it}
^{is} a complementary response ^{in the second}.

~~half-lines~~ ^{are} also ^{always} found together ^{by alliteration} into ^a rhythmic
group. ^{This, together with the constant variation of}
^{by alliteration} ^{feet in each half-line, prevents the tiresome monotony which}
^{comes in modern English of the position of the caesura}
each normal foot line of Anglo-Saxon

poetry contains four feet: two
each half-line. Each foot usually
^{richt der halber, sondern die beiden zusammen}
^{hörigen halberse bilden ein geschlossenes ganze.}

the caesura is usually in the middle of the line

201.
* We have in the "phrasing" in music a similar phenomenon, though of less frequent occurrence. There the opening measures ~~and~~ announce a strain that is not completed until ^{we reach} the closing ^{measures} ~~and~~ comprehend in the "phrase"; and to close the strain before the ^{completion of the phrase} ~~the~~ ^{syntactic} ~~measures~~ ^{measures} would give an effect of ~~incompleteness~~. Moreover, the half measures ~~are~~ ^{are} ~~not~~ ^{not} ~~allowed~~ ^{allowed}.

* No 2. The Caesura plays a more important part in Anglo Saxon poetry than it does in modern English. It is the dividing mark between the two half lines. In modern English, ^{poetry} its position is variable, as likewise in Latin and Greek. ~~but~~ not so in Anglo Saxon. Where its position is fixed, it falls invariably in the middle of the line, dividing it into two parts always ^{metreally} ~~metreally~~ ^{syntactically} equal. The caesura which is a rhythmical pause, can be ^{only} ~~only~~ where there is a logical or rhetorical pause. That is, it can ~~the~~ ^{it} not separate the parts of a word, nor can it separate words that are

...the same in the phrasing in music a similar phenomenon, though of less frequent occurrence. There the opening measures

~~has~~ announce a strain that is not completed until ^{we reach} the closing ^{measures} ~~has~~ comprehend in the "phrase"; and to close the strain before the completion of the phrase would give an effect.

* No 2. The caesura plays a more important part in Anglo Saxon poetry than it does in modern English. It is the dividing mark between the two half lines. In modern English, ^{poetry} its position is variable, as likewise in Latin and Greek. but not so in Anglo Saxon.

Where its position is fixed, it falls invariably in the middle of the line, dividing it into two parts almost ^{metreally} ~~metreally~~ ^{syntactically} equal. The caesura which is a rhythmical pause, can occur ^{only} where there is a logical or rhetorical pause. That is, it can ~~not~~ ^{never} not separate the parts of a word, nor can it separate words that are in close syntactical relation. For instance
Leremer. in his "Metrische und sprachliche Untersuchung" der A.

contains two parts: an accented, or
stressed part, called the arsis, and an un-
accented part called the thesis. There
are feet containing only an arsis, and
others containing what is sometimes called
a "secondary arsis," in addition
to a primary arsis. Such feet are us-
ually found in connection with heavy

compound words, containing a strong reem-
phasizing word accent.

According to Prof. Sievers, there
are five fundamental types of Anglo-
Saxon rhythm, depending upon the kind
of feet, and the order of arrangement of the
accented syllable ^{of the foot with regard to} the unaccented.

If the initial syllable be accented, it
is called ^{as in modern English} ~~an ascending~~ ^{ascending} rhythm; syllable takes the accent,
if the final syllable is accented, it is called an ~~ascending~~ ^{descending} ~~measure~~ ^{measure}.
Corresponding thus to the ~~trochaic~~ ^{similar} ~~and iambic~~ ^{rhythms} of modern English, represented by the trochaic and
iambic feet in classic prosody respectively.

For the objection to this term, see foot-note at bottom of page.
~~"In the book 'Des of the Germanic Verses', Paul & Baur's
and 'Die deutsche Sprache und Literatur', Volk
and 'Die deutsche Sprache und Literatur', Volk~~

(Continued from ~~X~~ back of page 9)
it can not separate a preposition
from the word it governs, an adjective
from the word it modifies, nor a li-
ting genitive from its noun. There must
be a pause - however slight - in the
sense as a condition for placing
the Caesura.

The Caesura is effective in ~~combination~~^{connection}
with alliteration in determining the
metrical type of each half-line. The
first alliterative word after the Caes-
ra always (with very rare exceptions
indeed) takes the first metrical accent
in the second half-line, and thus is
the key-note to the metrical structure
of the whole line.

The Caesura has a further metrical
function. In the Anglo-Sax line the
rhythm is not one continuous forward
movement as in the modern English
line; the first and second feet, and
the ~~second~~ third and fourth feet are much
more closely connected with each
other.

it can not separate a preposition from the word it governs, an adjective from the word it modifies, nor a limiting genitive from its noun. There must be a pause - however slight - in the sense as a condition for placing the Caesura.

The Caesura is effective in ~~combination~~ ^{connection} with alliteration in determining the metrical type of each half-line. The first alliterative word after the Caesura always (with very rare exceptions indeed) takes the first metrical accent in the second half-line, and thus is the key-note to the metrical structure of the whole line.

The Caesura has a further metrical function. In the Anglo-Sax line the rhythm is not one continuous forward movement as in the modern English line; the first and second feet, and the ~~second~~ third and fourth feet are much more closely connected with each other than ~~they~~ is the second with the third. Between ~~these~~ two the Caesura enters.

The first of Sievers' types, and that of by far the most frequent occurrence, is what he calls type 1. In this type the initial ~~foot~~ ^{syllable} in each foot takes the accent, and an accented syllable is followed by one or more unaccented syllables. The accented syllable is regularly long ^{in quantity} (or arsis ^{over 2}), representing accented syllables by a dash ~~across~~, and unaccented syllables by a cross, the following would represent the most common form of this type: $x / - x //$. ^{*put at foot of this page this parenthesis without parenthesis} (The ~~separate~~ feet are separated by a vertical line, and the close of the half-line is indicated by two vertical lines). There are a great many variations of this form of type 1. The ~~accented~~ ^{arsis} syllable instead of being long, is sometimes short (in which case it is represented in this discussion by a curve, instead of a dash) and the thesis, instead of consisting of a single unaccented syllable may consist of any number up to five. This statement with regard

(Continued from back of page 10)
making a break in the continuity of the
rhythm, so that the third and fourth feet,
instead of making a progressive continu-
ation of the first and second, really
constitute a complementary response to
them. But although these half-lines are
thus marked off by the caesura into
distinct rhythmical individualities, yet
the line,

* 2. ^{NOT} (off from opposite side). Quantity is here used
and ~~thought out~~ this part of the discussion,
^{the} classic sense - that is, a vowel
is considered "long" when long by nature, &
followed by two consonants. The writer is
not prepared to maintain, however, that
the Anglo Saxons really followed the classic
rule with regard to the length of syl-
lables. ~~It is~~ ^{It is} more probable, on the contrary,
that they determined quantity very much
as done in modern English; ~~by~~ by the im-
portance of the word, by the ease or difficulty
of its pronunciation, and by the requirements
of the meter. The adoption of this view

making a break in the continuity of the rhythm, so that the third and fourth feet, instead of making a progressive continuation of the first and second, really constitute a complementary response to them. But although these half-lines are thus marked off by the caesura into distinct rhythmical individualities, yet the line,

No 11

* 2. (~~off~~ from opposite side). Quantity is purely used ~~and~~ ~~thought out~~ this part of the discussion, ⁱⁿ the classic sense - that is, a vowel is considered "long" when long by nature, or followed by two consonants. The writer is not prepared to maintain, however, that the Anglo Saxons really followed the classic rule with regard to the length of syllables. ~~It is~~ ^{It is} more probable, on the contrary, that they determined quantity very much as is done in modern English; ~~by~~ by the importance of the word, by the ease or difficulty of its pronunciation, and by the requirements of the metre. The adoption of this view would simplify many of the variations of

* continued by 2 on back

The thesis, however, applies only to the
 first thesis, ~~in this type~~ ^{in this type} The closing thesis
 a half-line is limited to two syllables ^{in this type}
 According to Prof. Sievers, it can
 contain only one. See the discussion under
 "rules for Anglo Saxon versification"
 (over ~~the~~ ^{the} ~~low~~ ^{low}) ~~the~~ ^{the} other variation of this type
 is the substitution of two short syllables
 as the arsis of a foot, instead of one
 long syllable. This is what is called reso-
 lution, and it may occur in either
 foot. Metrically these two syllables are
 to be rendered in the time of a single
 "syllable", and the first of ~~them~~ them
 carries the principal stress of the accent.
 The following half-lines are examples
 of some of the most common forms
 of type A, the metrical scheme being
 written under ~~in every case~~ ^{in every case} each case:
 1. lone bi wealle. W. 80-a* long sceolde W. 3-3
 — x / — x // — x / — x //
 2. Metudes miltse. W. 2-a.
 x x x / — x // x x x / — x //
 3. verode drihten. Ex. 8-3.
 x x x / — x //

* indicates first half-line; 3. second half-line.

*To P. The occurrence of two or three syllables, especially if ^{they are} short and easily articulated, is of frequent occurrence in the first thesis. First theses of more than three syllables are rare.

(X Continued from ~~to~~ 2 on back of page 11)
the types given below. However, as the question has not yet been absolutely determined, we have followed Sievers in marking long and short syllables, when in the ar according to the ^{Latin and Greek} ~~classical~~ rules for quantity.

icgan to handum. Br. 4-a. are getides. W. 1-2.
x x // - x // - x x / - x.

crinas oā mæran. Sea. 87-a. fægere gctrymmed Br. 22-3.
x x x x / - x // x x x x // - x //

ft him an haga. W. 1-a. leode on getan. Ex 90-2.
- x / - x x // - x / - x x //

ic sceolde āna. W. 8-a. sē naes haten Hulfstan. Br. 75-3.
x x x / - x // - x x x / - x //

If these examples be scanned as modern English poetry is scanned, we will find that we have here a rhythm very similar to our trochaic and dactylic rhythms the same number of feet. And, of more importance, if we examine carefully, we will find that in those feet in the same half-line ~~compos~~ containing less of a dissimilar number of syllables, a ear demands that we give an equal interval of time - either by the slower pronunciation of the fewer syllabled thesis, or by filling up that measure with a pause - otherwise there is no perception of musical rhythm.

syllables in the first there is ~~going~~ be-
ginning the line with an ~~an~~ praestie
other, as it were.

The following are examples of the
most common forms of type B, with
metrical scheme written under each:

to wife wynn. Sea. 45-a. se to soe wat. W. 11.-3.
x - / x - // x x - / x - //

urne eard. Br. 58-a. and ealde sward. Br. 47-3.
- / x - // x - / x - //

ā nū mōma gebyrle. Sea. 90-a swā him Moyses be bēad. Ex. 101-3
x x - / x x - // x x - / x x - //

at him aet fōtum fōll. Br. 119-a. se se him lunge aer. Ex. 138-3.
x x - / x - // x x x - / x - //

Other variations of the normal type
are comparatively rare.

~~to which~~ fundamental.
The third type as given by Prof. Sie-
vers, ~~has~~ ^{metrical form} has no parallel in modern
English prosody. In this, the half-line
commences and closes with a thesis,
while the arses are in juxtaposition in
middle. This gives a peculiar rhythm,
at that ~~it~~ ^{this is} ~~the~~ ^{genuinely} rhythmic when recited,
as the Saxon gleeman in all probability gave

is certainly true. ⁷⁰
Can not be doubted; although this is
point which ~~should~~ not ~~be~~ admitted
those who deny the musical basis
of Anglo Saxon verse. ^{* (over)} In reciting ^{the rhythm of} this,
the ^{here given} time ~~here~~, as well as in the other types,
each foot, is approximately the same. But
distribution here is somewhat different.
The first arsis is followed by a pause
which is equivalent to the first thesis
time; while the entire second arsis
and second thesis ~~are~~ rendered in the time
of a single arsis, with ^{possibly} ~~perhaps~~ the
addition of as much time as is given
the second syllable of
a double ending in an iambic rhythm
modern English. We have ^{here} certainly
nothing of the effect of the double
ending. ~~As~~ additional proof
of the ^{Theory} ~~proposition~~ advanced above, if
an additional proof ^{be} ~~were~~ needed
the ^{fact of the} ~~fact~~ that ^{this} ~~that~~ is the only way
which the type can be read rhythm-
ically at all, we ^{can} ~~ought~~ mention the

* It must be admitted, however, that we do not have here what we might naturally expect, from the rhythmic scheme of the type - a combination of iambic and trochaic rhythm. Instead it is, more nearly, what we would call ^{in modern English verse,} an iambic rhythm with a double ending.

circumstance

14.21.

fact that the syllables of the second
foot - especially the arsis - are usually
light and easily articulated, thus
permitting their ^{rapid} pronunciation rapidly
admitting their connection with the thesis, in ~~the~~ a
connection with the thesis, in ~~the~~ a
connection equivalent to that of the first
thesis. (without difficulty). The for-
mer reason, however, is the more im-
portant; if we have regard to rhythm,
there is no other way in which this
can be read, especially in connec-
tion with the other types with which
it is connected in the long line.
~~the~~ The ~~the~~ most common form
the following are example
the type is $xx - | - x //$ or $xx - | i x //$.
We have then the usual variations of
this form, by "shortening" of the arsis, by "res-
olution" of the arsis, and by ~~the~~ increasing
number of syllables in each thesis,
and in both. The number of syllables in
the first thesis ~~may be as~~ ^{may be} as five

not that the syllables of the second
foot—especially the arsis—are usually
light and easily articulated, thus
permitting their ^{rapid} pronunciation rapidly
in connection with the thesis, in ~~the~~ a
connection equivalent to that of the first
arsis. (without difficulty). The for-
mer reason, however, is the more im-
portant; if we have regard to rhythm,
there is no other way in which this
can be read, especially in connec-
tion with the other types with which
it is connected in the long line.
~~this~~ The ~~the~~ most common form
the following are examples
the type is $xx - | - x //$ or $xx - | i x //$.
We have then the usual variations of
this form, by a "shortening" of the arsis, by "re-
duction" of the arsis, and by ~~the~~ increasing
number of syllables in each thesis,
and in both. The number of syllables in
the first thesis may be as ^{many} great as five,
while in the second thesis it is rare to find

no syllables, and ^{even then} all of ^{such} ~~these~~ ^{of} examples ~~could~~ ^{be} possibly as well be classed under other types, from the metrical standpoint.

The following are examples of ~~the~~ most common forms of type C, accompanied by the metrical scheme each written underneath: -

et se eorl nolde. Br. 6-a and on eniolegge. W. 42-b.

x - / - x //

x x - / - x //

er huacles eol. Sea. 60-a. us to seype gangan. Br. 40-b.

x x x / - x //

x x x x / - x //

† oā ford beran Br. 62-a.

wið oām tēn hēte. Ex. 224-b.

x - / - x //

x x - / - x //

† brimlāde. Sea. 30-a.

gedon will. Sea. 43-b.

- / - x //

x - / - x //

uprodor. Ex. 4-a.

and sinege. W. 34-b.

† / - x //

x - / - x //

This type does not have as many variations as A and B.

The fourth, ^{fundamental} type, ~~numbered D~~ according to Sievers' Classification, introduces us another measure which has no parallel in modern English. It is a type

19.23

~~which~~ ^{inquire} consists normally of a foot of
single syllable followed by a foot
of three syllables. This type would
seem to contradict in its face the
^{fundamental} principle ~~that~~ of all rhythm - that is
that rhythm depends on ^{the coordination of the ear} ~~equally~~ time - a
group of sounds and silences, recurring
at regular intervals. But such is
not really the case. We ^{only} have ~~held~~ further
an illustration of a fact which has
been already emphasized in ~~part~~
after I. We saw ~~there~~ ^{how},
after the type of rhythm has
been definitely established - after the
value of each foot or measure has become
roughly apprehended by the ear - the
number of sounds that comprise any
individual foot may be varied at
pleasure within certain limits, and
that rests and pauses ~~even~~ may ~~take~~
be used to ^{complete} ~~fill~~ out the normal time
the ...

~~which~~ consists normally of a foot of
single syllable followed by a foot
of three syllables. This type would
seem to contradict in its face the
^{fundamental} principle ~~that~~ of all rhythm - that is
that rhythm depends on ^{the coordination of the ear} ~~an~~ equal time -
groups of sounds and silences, recurring
at regular intervals. But such is
not really the case. We ^{only} have heard further
an illustration of a fact which has
been already emphasized in ~~part~~
after I. We saw there how,
after the type of rhythm has
been definitely established - after the
value of each foot or measure has become
roughly apprehended by the ear - the
number of sounds that comprise any
individual foot may be varied at
pleasure within certain limits, and
that rests and pauses ~~even~~ may ~~take~~
be used to ^{complete} ~~fill out~~ the normal time
of the measure. We have a similar
phenomenon here. The first foot, although

consisting of a single ~~foot~~ syllable,
as approximately the same time as
a second; but not all of ~~this~~ this time is
~~the~~ consumed by the articulation
of the single syllable; part of it is
covered by a pause, or rest. This
pause gives opportunity to fix the
organs of articulation so that the follow-
ing foot, which usually consists of a
very compound, may be more easily
articulated. ~~*(over)~~

In the form in which ~~the~~ Prof Siev-
er gives this type, there is in addition ^{what}
the primary accents in each arsis, ~~the~~
called a
"secondary accent" in the second foot.
This secondary accent must be care-
fully distinguished from the primary
accents. The latter are rhythmical accents,
whose principal function ~~is~~ ^{is} to mark
off the metrical divisions - that is, the
beat. The former is only a pronunciation
accent, the chief effect of which

* We do not deny, of course, that it is possible to read ~~the~~ such measures with the pauses or rests. ~~They~~ ^{unoubtedly} can be read as prose - as ~~Gurpurt~~ ^{should doubtless} and other scholars ~~say~~ ^{all Anglo Saxon poetry} and as many readers read similar passages in modern English ^{poetry} to day. + Can read a great deal of the very best poetry as prose if we will. But no one who is familiar with Anglo Saxon ^{verse} and who is acquainted with the fundamental principles will believe that a Saxon gleeman recites ^{of rhythm} ~~any~~ ^{any other} other way than with the pauses for there is no other way in which he could recite it ~~with~~ rhythmically.

to emphasize the relative importance
of its syllable, ^{to others in the foot} and increase its ^{relative} quantity
relative to them. Its chief rhythmic ef-
fect perhaps is to emphasize the pause
in the first foot by making clear the
two-syllabled time of the second foot -
which time the ear requires to be equal
to in ~~the first~~ ^{both feet} in order that if a rhythmic
effect shall be perceived. If the
Anglo Saxon Composer observed this
accent at all in his recitation, it
is very likely that it was only to the
tent mentioned, and, ^{that too, only} in heavy com-
pound words, containing in pronunciation
heavy secondary accent. It is in
connection with such ^{compound} words that this
the most frequently occurs. ^{The question} ~~is~~
~~is a unsettled~~ ^{unsettled} question as to whether words
having no secondary pronunciation accent
should be written with such ^{a secondary accent} ~~metrical~~
the only ^{metrical} ~~metrical~~ type ^(* over) ~~metrical~~ ^{metrical}
that ^{is} ~~is~~ ^{read as} ~~read as~~ ^{for} ~~for~~ ^{marking} ~~marking~~ ^{the word accent} ~~the word accent~~
previously mentioned: it emphasizes the
demand for a pause ^{in the previous foot} to fill out that
previous measure by making clear

* As was seen under the subject of word accent, there are some compounds which would, under this practice, be entitled to three ^{accents} ~~examples~~; for example, prinitisendra would require the scheme - ' / - ' - x // Afterewesendra, - ' x / - ' etc, thus ~~giving~~ ^{to} giving three pronunciation accents ~~for~~ such words!

~~Not~~ But it is questionable, to say the least, the third syllable in such words take any perceptible ^{stress} ~~accent~~ in pronunciation, even in prose. Those who

~~It has not yet been made clear by those who would hold that these secondary parts of compounds must take both the ^{word-accent} ~~pronunciation word-accent~~ and ~~metrical accents in the metrical scheme~~ (although it is ~~questionable~~ ^{perhaps} ~~in many instances whether they take any accent when standing alone in prose~~) have as yet by no means established their contention.~~

* (Put at bottom of page's foot note) of the term
~~term~~ ^{this expression is used instead} ~~the term~~
~~the term~~ "secondary arsis" ^{given by some. The}
~~term is unfortunate in that it~~
~~it may lead to the impression that the~~
syllable in question is entitled to a rhyth-
ical accent — which ~~is~~ is emphatically
not the case, for such an accent would
confuse the feet and destroy the rhythm.
~~Perhaps it would be better to use the~~
~~term "the accented syllable of the thesis".~~

item is the insertion ^{2 3.2 7} of a syllable ^{after the axis} in
The following are examples with their met-
rical first foot, thus providing that foot
with a thesis, and making it differ very
little rhythmically from type σ . Especially
this difference slight if the inserted
syllable is a "heavy" one. Sometimes
the case of ^{heavy} compound words that
usually ^{take the type} ~~assume~~ σ (or ϵ) as their met-
rical form, we have two syllables com-
pleting the thesis of the first foot. Such
examples we enter ^(contrary to Sievers) under type σ , ^{(contrary}
~~Sievers' practice of Sievers, who puts~~
~~under σ)~~, inasmuch as the sec-
ond accent ^(merely a pronunciation accent) is not here needed to show
the full time of the measure, and,
from the rhythmic standpoint at least
perhaps best omitted. We have also ^{rarely}
~~examples of a syllable inserted before the second thesis.~~
The following are examples, with
their metrical scheme, of some of the
most common variations of the σ
~~normal form~~ σ and ϵ .

The variations of the ~~two~~ normal forms of \mathfrak{D}' and of \mathfrak{D}'' are numerous, although the type itself is not of so great frequency.

The ~~st~~ fifth and last ^{fundamental} type given by Prof. Sievers is \mathfrak{E} , which in form is the converse of \mathfrak{D} . It consists of two feet, the first of which ^{contains} ~~consists~~ of three syllables, the second normally

ly me. Here, ^{again} the rhythm is preserved
the two feet of an unequal number
of sounds by supplementing the mono-
syllabic foot with a pause (or rest)
equivalent of the difference between the
^{interval} amount of time given ^{in each case} to the pronun-
ciation of the sounds in each foot.
The pause, coming at the end of the line,
easily and accurately supplied by
the ear! We have here the similar
abrupt effect that we are familiar
with in music, where the measure
is completed by a rest. ^{The significance} ~~This is to an~~
~~the abrupt effect noted by the ear is the greater if~~
~~it is a fact that the syllable~~
~~understand that the single syllable of the monosyllabic~~
~~is not pronounced abruptly, but in reality~~
~~the foot is prolonged beyond the time~~
the ~~prolonging of this syllable is~~ ~~prolonging itself~~ ~~the result of~~
an effort of the "rhythmic sense" to com-
plete rhythmically the measure and
the abrupt effect is felt only because the single mono-
syllable can not be prolonged through the time of two ~~feet~~
~~metrical basis of abruptness in verse.~~
~~This appears almost entirely restricted~~
~~the second half occur~~
heavy compounds, followed by a sin-

*"heavy" syllables, plus the light syllable of
the thesis, and so the pause has to be inserted
to complete the monosyllabic measure. The
phenomenon is ~~powerful~~ ^{certainly} ~~irrefutable~~, evidence of the
~~fact~~ musical basis of Anglo-Saxon,
as well as of modern English verse.

the monosyllabic word. If the Com-
pound is followed by more than a
single word, the practice is ^(following Sievers) to class
it half-line under type, in spite
of the ^{heavy} Compound word in the ^{preceding} foot
of these Compounds which give type
have, of course, ~~according to the~~
~~are of course considered~~
~~as a common conception~~ a second-
ary ^{word-}accent on the second component
part. The function which this ac-
cent plays is similar to that of
the secondary accent in ~~po~~ typed.
It is only a word-accent and must
not be given ^{the function of a metrical accent} ~~a rhythmic function~~.
Whether it should appear at all
in the metrical scheme, is the same
question that was raised there; and
the reasons pro and con are the
same. We shall follow J. Sievers'
precedent in using it, although
he uses it also in ^{rare} cases where there
is little apparent justification from
a rhythmic standpoint. ~~(over)~~

In this type, ^{as in the preceding,}
~~Here, as in type D,~~ there are two po-
sitions which the accented syllable of
the thesis may occupy: it may precede
a unaccented ^{part} syllable of the thesis
or it may follow it. The latter ^{position} ~~form~~
is rare.

The names given to the two types
arising from the difference in the po-
sition of the accented part of the thesis
are E' and E". Their normal forms
are $\overset{\cdot}{-} \overset{\cdot}{-} \overset{\cdot}{x} / \overset{\cdot}{-} //$ and $\overset{\cdot}{-} \overset{\cdot}{x} \overset{\cdot}{-} / \overset{\cdot}{-} //$. We have ^{forms}
in addition to these, ^{the normal type} the ordinary variations of these: the
resolution and "porting" of the arses,
and the accented syllable of the thesis,
and the insertion of an additional
short syllable in the thesis - either
after or before the ~~secondary~~ accented
syllable.

The following are some of the
most common variations of the nor-
mal forms of both E' and E", with
an accompanying metrical scheme:

reomægum ferr. W 21.-a. hrimealde sæ. W 4-3.
 — — x / — // — — x / — //
 erewerges mod. Sea. 12.-a. fealohilte sword. Br 166-3.
 x x — x / — // x x — x / — //
 ordwearda hryre Ex 35-a. leneomaga fela. Ex 21.-3.
 — — x / x x // — — x / x x //
 wrolice wraec Br 279-a. Fannones eyn. Ex 14-3.
 — — x / — // — — x / — //
 altyssa getac Sea. 35.-a. eadigra gehwam. Ex 4-3.
 — x / x — // — x / x — //

Prof. Sievers includes all the metrical
 forms that appear in Anglo-Saxon ver-
 sification under these five funda-
 mental types, with their variations. In
 this he has been followed ^{as far as we have} by all ~~the~~
~~able to learn~~ scholars who have accepted his
 theory of Anglo-Saxon prosody. There
 are some examples which are classed
 under type E, however, which might per-
 haps be better ~~divided into feet differently~~
 and more in accord with the logical
 relation of the words themselves to each
 other. Such are the following, selected
 from Exodus; accompanied by what would
~~not~~ ^{perhaps} be a better metrical scheme than that

according to which they are usually analyzed:-

withrod gefeal Ex. 491-b. deop lean geseod. Ex. 506-b.
— x / x — // + — x / x — //

redcas geswealh. Ex. 512-b. ham eft me eom. Ex. 507-b
x x / x — // — x / x — //

segen eall gedreas. Ex. 499-b. jōsepes gestreon. Ex. 582-b
x x / x — // — x x / x — //

traspell becwom Ex. 135-b. Wraemon gebod. Ex. 137-b.
— x / x — // — x / x — //

tnied geserāf Ex. 137-b. grimhelm gespeon Ex. 174-b
x / x — // — x / x — //

o aft gebād. Ex. 191-b. uplang gestod. Ex. 303-a
— x / x — // — x / x — //

cūf glād. Ex. 313-b. laudriht ge fah. Ex. 354-b
x / x — // — x / x — //

Also Ex. 371, 407, 459, 461, and others.

It is to be noted that in nearly every one of these examples the third syllable of the half line is ~~of~~ the weak syllable " ", which is logically closely connected with the word to which it is prefixed. In a rhythmic scheme it would much better logically ~~that~~ in a type with succeeding rather ~~than~~ ^{the} preceding word-

and it is very ³ doubtful ³⁴ ~~to say the least~~,
~~logically~~ it is a question whether
it should be placed under a type that
would separate it from the word to
~~which~~ ^{which} it logically belongs. We have no instance in
which an inflection ending which is some-
what similar to the "e" in the intimacy of its connection
with the word to which it belongs is thus separated.
However, since the examples are so rare,
they occur almost exclusively in the
second half-line. ^{we have followed} ~~it is~~ ~~then~~ ~~had~~ ~~any~~
and classed such examples under "d" rather than
~~devising to make~~ ^{it} a separate ^{type} ^{from}
under which to classify ~~these few~~
~~examples~~

Anglo-Saxon verification
of the five accepted types, those
possessing a descending rhythm are the
most abundant. At itself includes, upon
average, ^{nearly} half of all the examples.
This, it will be observed, is just
opposite of what is true in modern
English. There, ^{the descending rhythm} the trochee and ana-
pæstic — ~~the~~ are rare compared with
with the ascending — the iambic and
apaestic. The ratio of the descending
in modern English poetry

should be placed under a type that
could separate it from the word to
~~which~~ ^{which} it ^{logically} belongs. We have no instance
~~where~~ ^{where} an inflection ending which is some-
what similar to the "e" ^{in the intimacy of its connection} is thus separated
from the word to which it belongs.
However, since the examples are so rare,
they occur almost exclusively in the
second half-line) ~~it is perhaps un-~~
~~necessary to make~~ ^{we have followed Seever's} a separate ^{type}
under which to classify ~~these few~~
~~examples~~

Anglo-Saxon verification
of the five accepted types, those
possessing a descending rhythm are the
most abundant. At itself includes, upon
an average, ^{nearly} half of all the examples.
This, it will be observed, is just
opposite of what is true in modern
English. There, ^{the descending rhythm} the trochee and ana-
paestic - ~~the~~ are rare compared with
the ascending - the iambic and
apaestic. The ratio of the descending
^{in modern English poetry} the ascending rhythm is about 1 to 100;
~~modern English~~ * (over 102)

from the stem of the word of which it
a part. In fact, it is against the rule
for a metrical foot to separate the
parts of a ~~compound~~ word - Compound
of course, being an ~~an~~ exception - in
much as each foot has always ^{a certain} ~~some~~ ~~certain~~
degree of logical unity and completeness
in itself. In addition to this, ^{it is clear} there is
nothing that can be said from the
rhythmical standpoint against the div
of the half-line as we have marked
above. On the contrary, the rhythm itself
gest this division.

* 2 (from opposite side).
in Anglo Saxon it is about 5 to 3. ^{class} Type k is
course, ^{as} ascending rhythm; types d and e, ^{as} descending rhythm.

We give here the recurrence of the various ^{types} in the Beowulf, Elene, Juliana, Crist, Andreas, Guthlac, Phoenix, Exodus, Battle of Maldon, Wanderer and Seafarer. The figures for the Beowulf are ^{those} given by Prof. Sievers; the next three by Dr. Prichard, and for the last three, by Dr. Cremer.

	A	B	C	D	E	A	B	C	D	E
Beowulf	1701	293	501	464	138	1118	721	564	403	329
Elene	562	202	265	211	71	471	403	267	101	61
Juliana	346	106	141	113	72	277	218	164	40	36
	1246	443	444	386	130	1128	783	568	137	177
Crist	703	303	278	284	90	727	468	276	99	88
Andreas	748	226	348	306	74	736	373	340	166	92
Guthlac	673	161	238	169	67	491	389	301	78	62

	5638	1535	1994	1809	569	4684	2953	2171	1000	189

Total number of half-lines, 23144; whole lines, 11572.
 Total of each type: A 10322. B 4490. C 4165. D 2809. E 1358.
 Total of descending rhythm, 14489; of ascending rhythm, 8655.

With regard to the union of the types
in the half-line, investigation so far has
not been able to derive any very defi-
nite laws. Bremer, ^{but} after a careful
study of some 7,500 lines, shows that
after type A in the first half-line, with al-
literation in the first foot, and ^{also} with double
alliteration, the line is most frequently
completed by a descending measure. That
after A³, and after B, ^{and} C, with whatever allitera-
tion, the line is most frequently completed
by an ascending measure. This seems
to indicate that ^{outside of type A, generally} the poet preferred to
combine ascending and descending
rhythms, rather than have the whole line
of the same rhythmic type. That A is
an exception to this may have been due
to the fact ^{that it occurs with such} ~~of that the~~ great frequency
with which that type everywhere in the line.
Bremer's investigation also indicates that
the character of the alliteration ^{also usually} varies
with the nature of the rhythms connected in
the whole line.

A careful study of the Wanderer, Se-
 arer, Godus and Battle of Maldon shows
 that there is a tendency to repeat the
 same type, not so much in the same
 line perhaps, but in two consecutive
 lines; sometimes even in three or four.
 This is most common, of course, under
 A, because of the preponderance of that
 type. Of the entire 2200 half-lines in
 these four poems we find the same
 type ^{repeated in the same line, or} appearing in two consecutive lines,
 53 times; in three consecutive lines 22
 times, and in four consecutive lines
 3 times, making a total of 78 - about
 one eighth of the whole. These examples
 are distributed among the various types
 as follows: A, 208 examples of the same
 type occurring in two consecutive lines, 20 of the triple
 occurrence; in three consecutive lines, and 3 of the quadruple
 occurrence; B, 17 examples
 of the same type occurring in two consecutive lines, and 1
 of the same type in three consecutive lines;

11 examples of ^{triple} occurrence, and 1
~~of the same type in two consecu-~~
~~tive lines, and one of the same type in three~~
~~consecutive lines; 8, 10 examples of the~~
~~same type in two consecutive lines and~~
9 examples of the ^{double} occurrence
under two
consecutive lines.

The most common ~~form~~ position taken
by the repeated types, is the second half-line
each. Of this we have 68 examples of the
double occurrence, 16 of the triple, and 3
of the quadruple. Of each occurring in the
first half-line, we have 47 examples of the
double occurrence, and 6 of the triple. Of
the occurrence of the first in the second
half ^{of the first line} ~~line~~, and the second in the first ^{of the second} ~~half-line~~,
we have 59 examples; of the occurrence of
the first in the first half of the first line,
and the second in the second half of the
second, we have 46 examples; and of the
repetition of the same type in the same
line we have 33 examples. From this it
~~may~~ ^{seem} that the poet probably
avoided the monotony that might ~~possibly~~

rise from the repetition of the same
in the same line.

The following are examples of the
double, triple, and quadruple occur-
rence, with the repeated type in its
most common position:

brimlāde bīdan seólde.

nihtseu nōsan sūwde. See 30-31.

~~gumnon bytegian~~

ðæt būrgwara bræhtma kase,

æt eald eīta gewore idlu stōdan W. 84-85-86-87

The conclusion seems to be that the
poet was allowed great latitude in ^{com-}the
fining of his types into the normal line,
and that he was governed only by the
ever principles of rhythm.

anacrusis (or prelude).

In types beginning with an accented syllable, we sometimes find one or two - and very rarely, even more - unimportant unaccented syllables preceding the type proper. These constitute what is called an anacrusis, or prelude. They are not to be considered as part of the type, and are to be ^{recited} ~~pronounced~~ very ~~for~~ faintly and ~~not~~ hurriedly - perhaps slurred.

The anacrusis is not peculiar to Anglo Saxon poetry, but is found in Latin and Greek, and also, as we have seen, in modern English. It does not seem to ^{answer} ~~perform~~ any special rhythmic purpose, or to perform ^{any} intentional function. It can contain no important or accented word, and it seems to be a kind of license of which the poet avails ~~himself~~ ^{be} himself when it would have been inconvenient for him to place the ^{words} ~~particles~~ which usually constitute the anacrusis in any other place.

The anacrusis occurs most frequently
 in the first half line. ~~The first half line~~
 frequently ~~as we would expect inasmuch as~~
 it is extra metrical, ~~in the first half line~~
 a most convenient place for it though
 we would expect, inasmuch as it is extra metrical, in the first
 we have also ~~some~~ 2 or 3 anacrusis in the ~~half~~
 second half. Types B. and C., inas-
 much as they begin with a thesis,
 do not take an anacrusis. The short
 syllables, ^{there are} ~~would~~, of course, just ~~a~~
 prefixed to the thesis, making an
 expanded thesis - which is very com-
 mon in both of these types.

The following are a few examples
 of anacrusis, which occurs most
 frequently in type A, and only ~~very~~
 rarely in type D, and more rarely still
 in type E.

Alliteration.

Alliteration consists, as in modern English, in the use of a succession of words with the same initial sound. There is this difference, however: each vowel or diphthong may alliterate with any other vowel or diphthong; as,
dē oōō gīdo oōō eēghēte. Sea. 40.

Each consonant alliterates only with itself, except that *g* alliterates also with phonological *j*(i); as,

e goldgiēfan, swylec iū wæron. Sea. 83.

emelfear gnornat, nāt his iūwine. Sea. 92.

lōr grēne grūnd: Jūdisē fēoa. Ex. 312.

rimhēlma gegrīnd, oāer Jūdas fōr. Ex. 330.

ōld and godweb, Jōsēpes gestrēon. Ex. 588.

Until the later Anglo Saxon period, the consonant groups *sc*, *sp*, and *st*, were treated as a single letter, each group alliterating only with itself, and not with the

40, 44
single initial consonant! etc.,

ormas oær stanelifu bótan, oær him stearn mēwæc. Sea. 23.

gestaþelade stíðe grúndas. Sea. 104.

Towards the close of the period, however, this practice was not observed. Also ^{then} ~~at this time~~ an initial h before a vowel was frequently disregarded, the vowels ^{themselves} ~~themselves~~ altering; as,

hóllofærnus inlyfjendec. Judith 180.

~~unimportant~~ Syllables after ~~unimportant~~ prefixes such as be-, ge-, prepositions, &c., may be considered as initial, and take alliteration; as,

litre bróstecare gebiden hæbbe. Sea. 4.

hōngen hrīngicem: hægl scūrum fleag. Sea. 17.

ut hē gewyree, ær hē mweg seyle. Sea. 74.

swete forswelgan ne sār gefelan. Sea. 95.

Likewise in Compounds, the second ^{of the compound} part, as well as the first, may be considered initial, and alliterate; as
goldgiefan, swyðe in wæron. Sea. 83.

in the texts which give both e and k, ~~it~~
 y are, of course, the same letter, and al-
 terate with each other; as,
 4 ven to gebédan Háfde kyninga wíldor. Ber. (A. v. 8.)

~~The most common type of alliteration~~
 the function of alliteration. English poetry
 Alliteration, which ^{in modern} occurs merely as
 incidental ornament, ~~conducting to~~
 melody, ~~in modern English poetry,~~
 performs a much more essential
 function in Anglo Saxon ^{verse}. It is the key
 of Anglo Saxon versification, and divides
 the ~~verse~~ ^{line} into feet, just as the bar ~~marks~~
 of music into measures. Because of the
 varying number of syllables in the thesis,
 and because of the different position of
 the metrical accent in the various
 lines, it would be almost impossible, ~~for~~
 in many cases, for the ear to make
 that coordination of the recurrent groups
 of sounds which results in the perception
 of rhythm. In modern English poetry this
 coordination is effected ~~only~~ ^{by the} ~~word~~

regular recurrence of word or sentence
accent, or the conjunction of both, but in
Anglo Saxon poetry these accents are im-
mensely intensified by alliteration, and
the Coordination rendered correspondingly
easier. Alliteration, or "head rhyme", as it
sometimes called, is almost as effec-
tive in marking off the lines into feet
as end rhyme is in dividing poetry
into lines; and the function performed
in each case is similar. The alliter-
ation must come either at the beginning
of the foot (as in types A, C, D and E), or
must come at the end (as in types B and
F) and as the caesura divides the line
into halves of two feet each, we are
able to determine these feet with as
absolute certainty as in English versifi-
cation, although the thesis may contain
four or five syllables.
The longer the line and the more diffi-
cult the Coordination, the more copious
the alliteration. In the long lines,

Another function of alliteration is to bind together the ^{two} half-lines into ~~the normal line~~ ^{the whole}.

Although the ^{half-lines} ~~are~~ are separated by the caesural pause, and in one sense are complete in themselves, yet the recurring alliteration ^{comprehends} ~~completes~~ ^{and more} ~~completes~~ them ~~together~~ into more artistic whole, making the line, and not the half-line, the true unit of the Anglo Saxon rhythm. Just as in music two measures are ^{sometimes} frequently combined into a "phrase", and the first measure without the answering second ^{would} ~~will~~ give sense of rhythmic incompleteness, so in Anglo Saxon poetry the second half-line answers to the first, and completes the rhythm ~~that~~ ^{to the first} begun ~~(announced)~~ in the first.

Sometimes in the later poems we have what might be considered as an approach to a modified form of strophic structure, - the alliterating letter is repeated two ^{or even three} consecutive lines thus binding them more closely ^{together} ~~together~~ ^{each other} rhythmically at least, than ~~that~~ are ~~to~~ the others. As

44 48

menede to wiste: myms call gedrens.

For ^{uāt}son se seal his uinedy'sitnes. #36-37

Maeg i^{te} mē sylfum sozziedwrean,
 siwas sezan hū ic geswmedaȝum. Sea. 1-2.

faeste mid folman, and ne forhtedon na.

Oā hē haefde ðæt fōlc fægore gctrymmed, B. 21-22
 Similar examples:

~~Similar examples are: Standeris 48-49,~~

wā ðære waelstowe wealdan mōte.

Ad dit.

Additional examples are: K. 48-49, 64-65, ~~66-67~~
a. 63-64, 85-86. B. 29-30, ~~71~~ 71-72, 81-82, 110-111,
6-137 + 15 others.

It yet more common phenomena is the
occurrence of ^{the} same alliterating letter
every other line, and even in four alter-
nate lines in succession. The question
naturally suggests itself as to whether
there is any similarity in ^{the} effect
produced by this, and that of modern
English alternate rhyme.

The following are examples:

~~bræran mid höndum~~ ~~brimealde~~ ~~sæ~~
 vadan vræclastas: výrð bið ful áraed
riðra vælskahta, vinernaega hryre. W. 5-7.
 omme hē be ēlifum enossas ēalde georūngon. Se
ildum elōnumum ðær ðā ceare seofedun. Sea. 8-10.
 ā hē for ēode fæse gemunde,
lotan m ðā folce, saet sē m foldan laeg.
rynd and geferan, saet hi for ēodon. B. 225-227-229.

omme eall ðisse worulde wela weste stōndes,
winde twāne wallas stōndas,
frīas ðā wīnsalo waldend lēgað.
olne hē welle: sume wīg fornōm. W. 74-76-78-80.

Additional examples: W. 6-8, 14-16, 26-28,
 67, 85-87, 98-100. Sea. 28-30, 32-34, 54-56,
 91-93, + 4 others. B. 2-4, 13-17, 18-20, + 15 others.

consisting of six ^{to} feet, double alliteration
the rule in the first half-line, and
sometimes it is threefold; as;

iman to ðam gylðman gylðe se hē him to gode geteð
- Dan. 204.

or for ða hæðenan hæftas fram ðam holgan erihtan. Dan. 261.

In those types composed of feet of an
unequal number of syllables - d. ~~and~~

d & - double alliteration is much more
common than in the simpler types, A, B,

and c. Thurneysen in his "Metr. und Sprach.

Elene, Juliana und Crist" finds that
of 10,000 half-lines of each type, 5347

A, 3236 of B, 1040 of c, 7736 of d, and
62 of e, have double alliteration. This

increase of ~~the~~ alliteration in the types
composed of unequal feet helps the ear

to coordinate the groups composed of
each an unequal number of ^{sounds} ~~syllables~~

(put in a sheet.) Alliteration has, of course incidental

the additional function of orna-
mentation - as in modern English.

The repetition of the sound is pleasing
to the ear, and adds melody to the lines.

It furnishes additional material for
at Coordination in which the ear takes
much delight.

The rules for alliteration.

~~The alliteration falls always upon the arsis of a foot, never upon the thesis.~~

The alliteration must fall upon the
most important word, or words, in the
half-line. It usually coincides with the
word accent, and it must coincide with
the sentence accent, and ^{with the} ~~the~~ ^{syntactical}

accent. frequently there is a conjunc-
^{alliteration with all three accents.}
tion of ^{all} ~~three~~. ~~The alliteration falls~~
~~on the arsis of the foot, never upon~~
~~the thesis.~~ (HP)

As a rule, pronouns, conjunc-
tions, prepositions, and ^{other} particles in gener-
al do not take ~~the~~ alliteration. This
falls most frequently upon nouns and
adjectives, ^{in general} ~~the general~~ and of two sub-
stances occurring together, the most im-
portant always takes the alliteration.

Prepositions and similar words ^{may} alliterate,
however, when ^{they are} ~~for the sake of clearness~~
~~of contrast~~, it is desired to make
one especially emphatic, and ~~they~~
it has become of leading importance in

a sentence, as to on lōciao,
waet! gē nū lōciao me to braedwyrde
seal nō to hōthort and aēfter oon. Ph⁵ew. 238.
hūst oū, sālha, hūst sis folc sige? Bu. 45.

t oā ūp hēran āeselinga gestreow. Bu. 1920.
under, mē āenig oser. Rāto. 41.

d oū māestan inalgenōrymme eynes. Crist. 1009.

Nouns (including the substantive forms of the verb)

and adjectives are, in general, the most

important words in a sentence, and con-

sequently most often take the alliteration.

Two or more half nouns in the

one half-line of equal importance,

one, ^{which occupies} ~~occupies~~ the emphatic position

that is, which comes first - regularly

takes the alliteration. If any other word

could be especially emphatic, however, ^{the} ~~it~~

~~alliteration falls upon it~~ ^{alliteration}, no matter what

part of speech it ~~may~~ ^{is} be. The principle

that alliteration marks the impor-

tant idea, ~~no matter~~ by whatever ~~part~~

word expressed.

place of alliteration.

Alliteration falls always upon the arsis,

never upon the thesis of a foot.

Now every complete line there must be
at least one alliterating word in each
half. There is no principle in Anglo-
Saxon versification more inflexible than
this. Those lines which show an entire
lack of alliteration are due, almost
without question, to a corruption of the
text. In the four poems analyzed
in this discussion there are only three
such: Sea. 25, Ex. 339, and Ex. 413. The
first of these is marked as corrupt in
the text; there is a break in the manu-
script in the line following the second;
and it is more than probable that the
third is likewise defective.
~~A rule~~ ^{As a rule} a foot ~~can have~~ ^{is permitted} only one
alliterative word; where examples out-
side of this rule occur, it is ~~question-
able~~ ^{apparently} whether they are ~~not~~ to be considered
merely accidental and not ~~purpose-~~ ^{as an intention.}
~~aimed at~~ ^{for triple alliteration.} Such examples are
following:-
wāteah in slæp; ēḡsan stōdon. Ex. 490.
le ofer eorðan ealle cræfte. Ex. 436.

gan ofer eorðan yrfelāfe. Ex. 403.

it ie scolde āna ūhtna gehwylce. W. 8.

ider hrēora gehjgd hweorfan wille. W. 72.

ll osse yldo ēsse ēcghete. Sea. 70.

seal ord and ēc aer gestēman. L.B. 60.

seole gē swā softe sine gegāngen. B.B. 7.

nd wearo Wulfmaer waelraeste gecēas. W. 113.

There is usually only one alliterative word in the second half-line, and as a rule that in the arsis of the first foot. This is principal alliteration of the line, and called the "head stave". In the four lines examined, only ~~three~~ certain examples of ^{lack of} alliteration in this place were it, with:

gora gesynto, saer gē sisien. Ex. 272.

tes set ende. Wigbord seīnon. Ex. 466.

We also have

ase wearo set hilde offa forheawen, W.B. 288,

but the line is marked in the text as being corrupt.

Alliteration in both feet in the second half-line is rare; the following are examples:

Ac, mæg ðerignöd wýrðe wiðetandan. H. 15.
grates glüostafum þiome þondscēawað. H. 52.
þáð oððe ylðo oððe ecðhete. Sea. 70.

~~Tom þā to þe rot over þingdene. B. 29. Also 165, 198, 230, 32, 44~~

~~sendan to þe sœmenum snelle. Br. 29. Also 165, 198, 230, 32, 44;
5, 315, 288.~~

~~odenholde, þā mæs ðriðða wile. Ex. 87. Also 187, 190,~~

~~5, 451, 38, 113, 298.~~

~~Double alliteration in both half-lines is~~
~~More unusual still, ^{in. norm. lines,} is double allit-~~
~~ation in both half-lines. It occurs~~
~~the following places:~~

æt gð visnes þárræes | mid þáfole forgyldon Br. 32

þre and ándraed, ageaf þim andsnare. Br. 44.

þeene gefýlled, þrimbeama þela. Ex. 38

þinon scýldþreosau, seædo swiðredon. Ex. 113

þrahan Isaac. ædfyr þbran. Ex. 398.

Also H. 52 ^{III (Engl. lines)} O. 40.

By far the most common type of allit-
ation is double alliteration in the first
half-line, with ~~alliteration in the first foot only~~ ~~single alliteration~~ in
the second half-line; as

æt þim ánhaga áre geþides. H. 1.

þre þreostecare geþiden hæbbe. Sea. 4.

þorr áfýsan and fóro gárgan Br. 3.

þeclleo wórdriht wera enþeocsum Ex. 3.

the total ~~1008~~¹⁰¹² Complete lines in the Manders,
Farer, Battle of Maldon, and Exodus, ~~556~~⁵⁷⁰
more than half - are of this type. Three
these might possibly be included under
other types: Pt. 56, Br. 233, and Ex. 89.

The number in each poem is: Pt. ~~56~~⁷⁰; Sea. 58, #
47; Ex. 295. In proportion to the number of
lines in each poem the occurrence of this type is fairly
uniform; it comprises about ~~55%~~^{55%} of Pt. ~~56~~⁷⁰,
of Br. 55% of Sea., 45% of Br., and 51% of Ex.

The next most common type is alliteration only
of the next type - alliteration in the first
foot of each half-line, as
of each half-line. we find 298 exam-
ples; 17 of these can possibly be classed
under other types. The following are ex-
amples of this type:

Wras forðmon ðisca orȝoc. Pt. 99.
irfoohwile oft orōwade. Sea. 3.
æt se eār nolde ~~yrho~~ yrho gōolian. Br. 6.
līgendra gehwām lāngsumne rāed. Ex. 6.
The total in each poem: Pt. 25; Sea. 29;
Ex. 170.

There are 294 examples of this type -
little more than one fourth of the entire
number; 17 examples included here can
possibly be classed under other types.

afarer, Battle of Maldon, and Exodus, ~~556~~⁵⁶²
more than half - are of this type. Three
these might possibly be included under
other types: Pt. 56, Br. 233, and Ex. 89.

The number in each poem is: Pt. ~~556~~⁵⁷⁰, Sea. 58, #
147; Ex. 295. In proportion to the number of
lines in each poem the occurrence of this type is fairly
uniform; it comprises about ~~55%~~^{55%} of Pt. 56, ~~55%~~^{55%}
of Pt. 55% of Sea., 45% of Br., and 51% of Ex.

The next most common type is alliteration only
in the first foot in each half-line, as
in the first half-line. We find 298 exam-
ples; 17 of these can possibly be classed
under other types. The following are ex-
amples of this type:

öras forðrömon áisca orjóe. Pt. 99.

irfoohwile oft oróvade. Sea. 3.

æt se eorl nólde ~~yrhoo~~ yrhoo góolian. Br. 6.

figendra gehwám lánsumne ráed. Ex. 6.

The total in each poem: Pt. 25; Sea. 29; Ex. 170.

There are 294 examples of this type -
little more than one fourth of the entire
number; 14 examples included here can

possibly be classed under other types.

The type is distributed as follows among
individual poems: Pt. 25; Sea. 29; Br. 169;

176. The occurrence is ^{not} ~~as~~ ^{quite proportionally} uniform
in the preceding type. The following is
percent of each poem comprised in
type: W. 22%, Sea. 27%, Br. 21%, and Ex. 30%.
percentage of Ex. ~~is~~ is large pro-
portionally, and that of W. small compared
with the preceding.

The third type in frequency of occur-
rence is alliteration in the second foot
of the first half-line ~~with~~ and in the
first foot of the second half-line; as,
'et bio in eorle in dýrhten Seaw. W. 12
'ug ic be me sylfum stogiedd wrícau. Sea. 1.
ðám man mihte on enāwan ðactse emíht nólde. Br. 9.
ter him gesealde sigora wáldend. Ex. 16.

This type numbers 218 examples, 30 of which
could possibly be included elsewhere. They
are distributed as follows: W. 14; S. 12; Br. 97;
Ex. 95. The percent of each ^{poem} ~~type~~ under this
type: W. 12 1/2%, Sea. 11%, Br. 30%, and Ex. 16 1/2%.
We note here that the occurrence of
this type is by no means uniform, and
that the frequency of its use corresponds
in a general way with the date of the

proportionally in the preceding type. The following is percent of each poem comprised in a type: W. 22%, Sea. 27%, Br. 21%, and Ex. 30%. ~~but~~ ^{the} percentage of Ex. ~~is~~ is large proportionally, and that of W. small compared with the preceding.

The third type in frequency of occurrence is alliteration in the second foot of the first half-line ~~with~~ and in the first foot of the second half-line; as, *let bio in eorle indrihten Seaw.* W. 12
ug ic be me sylfum stogged wiceaw. Sea. 1.
ðain man mihte on enāwan oæt se eniht nōde. Br. 9.
ter him gesealde sigora waldend. Ex. 16.

This type numbers 218 examples, 30 of which could possibly be included elsewhere. They are distributed as follows: W. 14; S. 12; Br. 9; Ex. 95. The percent of each ^{poem} ~~type~~ under this heading: W. 12.7%, Sea. 11%, Br. 30%, and Ex. 16½%. We note here that the occurrence of this type is by no means uniform, and that the frequency of its use corresponds in a general way with the date of the poem. The two earlier poems, the W. and Br.

and the Seafarer, ⁵⁴ ⁵⁸ use it very sparingly; the Exodus, coming at an intermediate rate, but probably nearer the ^{two} former, has an increased percentage; while the Battle of Maldon, ~~whose~~ ^{the} date of which is 993, has nearly one third of the entire number of its lines ~~under~~ ^{of} this type. The ~~question~~ explanation of the cause of this increase, and its rhythmic effect, is ^{a question} beyond the scope of this discussion, however interesting it might prove.

The remaining types of alliteration are significant in their occurrence.

^(see also on next page)
Here is one example of the first foot in the first half alliterating with the second ~~half~~ ^{foot} in the second half. ~~its end.~~ Wigford seinnon. Ex. 466.

Also a single example of the second ^{only} foot in each half alliterating: ~~whose words are hidden~~ Offa for beaven. Br. 288
This line is marked as ~~corrupt~~ ^{correct} in the text.

~~Already mentioned~~ ~~the~~ ^{the} first foot in the first half alliterating with ~~both~~ ^{the} first foot in the second half & three

; the Exodus, coming at an intermediate
ate, but probably nearer the ^{two} former, has
an increased percentage; while the Bat-
of Malden, ~~whose~~ ^{the} date of which is 993,
has nearly one third of the entire num-
ber of its lines ~~under~~ ^{of} this type. The ~~fact~~
explanation of the cause of this increase,
and its rythmical effect, is ^{a question} beyond the
scope of this discussion, however inter-
esting it might prove.

The remaining types of alliteration are
significant in their occurrence.

There is one example of the first foot in
the first half alliterating with the sec-
ond ~~half~~ ^{foot} in the second half.
This is not ended. Wiggard seinnon. Ex. 466.

Also a single example of the second
foot ^{only} in each half alliterating;
these words act hidden. Offa for between. Br. 288
This line is marked as ^{corrected} ~~correct~~ in the text.

~~As already mentioned~~ ~~the~~ the first foot
in the first half alliterating with ~~both~~ ^{the}
second half, three examples:
gan wigheardne, se was hater Wulfstan. Br. 75.
d on frote a mæg gnornian. Br. 315.
gora gesynto oær se seon stien. Ex. 272.

first of these is marked in ~~the~~ text as probably corrupt.
likewise the second foot in the first-
half alliterating with both feet in the
second-half, ^{four} ~~five~~ examples:

ā ^{the} ~~ā~~gend ^{up} ~~ā~~ræde. Ex 295.

teron inge men ealle setgaedere. Ex 190.

teron Egypte eft meyrde. Ex. 451.

Don āra gehivile ^{all of which occur in Ex. 187.} ~~ā~~lædde. Ex 187.

so of these examples, ^{might be included elsewhere.}

so 8 instances of double alliteration in

the half lines - ^{the} examples ^{have been} already

noted; they are W. 52. III. Sea 70. Br. 32. 44. Ex. 38. 113. 398.

We find ~~six~~ ^{seven} examples of the first
foot in the first half-line alliterating
with ~~the~~ both feet in the second half-line:

maeg uerigmod wyrde wiostondan W. 15.

seindan to ðe sāmum snelle. Br. 29. Also 165. 198. 230.

ā ðær eorþ uirod ðe anlæddon. Ex. 194. Also 97.

^{these examples} ~~this type~~, it is noted, are chiefly in the
the poem, the Battle of Maldon

crossed alliteration.

Very rarely we find the first foot in
the first half-line alliterating with the
first foot in the second half-line, and
the second foot in the first half-line al-

alliterating with both feet in the
end-half, ~~four~~ ^{four} examples:

á ^{the} ágend up áræde. Ex 295.

æron inge men ealle ætgaedere. Ex 190.

æron Egypte eft meyrde. Ex. 451.

Don ábla gehwile ^{all of which occur in Ex. 187.} ut álædde. Ex. 187.

Two of these examples ^{might} be included elsewhere.

So 8 instances of double alliteration in
the half lines - ^{the} examples ^{have been} already
noted; they are W. 52. III. Sea 70. Br. 32. 44. Ex. 38. 113. 398.

We find ~~six~~ ^{seven} examples of the first
not in the first half-line alliterating
with the both feet in the second half-line:

e mæg uerignod wyrd wistondan W. 15.

e sendan to ðe sæmum súlle. Br. 29. Also 165. 198. 230.

ðær eorþ uerod ee ulæddon. Ex. 194. Also 97.

These examples, it is noted, are chiefly in the
the poem, the Battle of Maldon

crossed alliteration.

Very rarely we find the first foot in
the first half-line alliterating with the
first foot in the second half-line, and
the second foot in the first half-line al-
literating with the second foot in the sec-

d half-line; as ⁷⁰ 56.60
hy'rat su p'álda hu'æt sis fole s'égæ? Br. 45.
for'ow'igas fole æfter w'olenum. Ex 350.
~~Two examples.~~

There occurs also very rarely the first
foot of the first half-line alliterating
with the second foot of the second half-line,
and the second foot of the first half allit-
erating with the first foot of the second
half; as,

waet we fear and neah gefrigen h'abas. Ex 1.
æfter ðam n'ordum w'erod eall ar'as. Ex 289.
~~Two examples.~~

Frucht, ^{in his dissertation} ~~in the work~~ already referred to,
takes the position, in opposition to Rieger,
that this "crossed alliteration" is not to be
considered as an artistic form, striven for
by the poet, but that it is merely acci-
dental, and was perhaps never perceived
as alliteration by the poet himself.
In support of his view, he shows that in
1406 normal lines without double alliter-
ation in the first foot,
in the three poems which

chýrat sú sáclida hwaet sis fole séges? Br. 45.
foróvígas fole after vólemum. Ex 350.
~~Two examples.~~

There occurs also very rarely the first
foot of the first half-line alliterating
with the second foot of the second half-line,
and the second foot of the first half allit-
erating with the first foot of the second
half; as,

hwaet we fear and meah gefrigen bábas. Ex 1.
after ~~ðam~~ nórdum werod eall árás. Ex 299.

~~Two examples.~~

Frucht, ^{in his dissertation} ~~in the work~~ already referred to,
takes the position, in opposition to Pieger,
that this "crossed alliteration" is not to be
considered as an artistic form, striven for
by the poet, but that it is merely acci-
dental, and was perhaps never perceived
as alliteration by the poet himself.

In support of his view, he shows that in
1406 normal lines without double alliter-
ation in the first foot,
in the three poems which he analyzed,
there were only 64 examples of crossed

alliteration; as there are just 19 different
alliterating letters, or groups of letters, he
argues that we ~~have~~ must expect ~~1406 ÷ 19 =~~
74 examples (1406 ÷ 19), even if this crossed al-
literation is accidental. This calculation, it
seems to me, ~~is~~ is worth little in showing
how frequently crossed alliteration may
be expected to ~~appear~~ ^{occur}. All that it shows
is that in 1406 alliterating lines, each
alliterative letter ~~might~~ ^{may} be expected to ap-
pear 74 times, provided ~~they are all used~~ ^{all the alliterating letters are}
with the same degree of frequency. But
as there are a number of ~~positions~~ ^{positions} in both
half-lines in which a letter may stand and
not alliterate + (he excludes only one of these -
namely alliteration in the first half) his
calculation by no means shows that in
74 cases out of 1406 the alliterating letter will
be in each half-line either of the two orders
which give crossed alliteration.

While Fruecht's argument is by no means
fatal to the subject, yet the rarity of the
occurrence of the phenomena seems to
be sufficient to indicate that the Anglo-Sax-
on poet did not specially strive after it.

perhaps it is going too far to say that he did not consciously perceive it as alliteration. It is more probable that he ~~did~~ ~~it~~ ~~seek~~ felt that to introduce a secondary alliterating letter into the line would weaken the force of the primary alliteration, and that the unity of the ^{half-}line would be impaired by connecting the ^{separate} ~~similar~~ feet of the half-line by alliteration, rather than the half-lines ~~as~~ themselves.

Summary of the types of Alliteration in the Wanderer, Seafarer, Exodus and Battle of Maldon. The feet are numbered a, b, c, d, in the order of their occurrence in the normal line)

	a-b-c-a-c b-c-a-c d-a-c d-b-c {a-d} {a-d} {b-d} {b-d} {b-c} No. of lines											
Wanderer	70	25	14	1	2							115
%	61%	22%	12%		+							
Seafarer	58	29	12		1	2		1	1		1	106
%	55%	27%	11%									
Exodus	147	69	97	4	2						1	323
%	45%	21%	30%									
Battle of Maldon	295	171	95	2	3	5	1	1		1	2	570
%	51%	30%	16½%									
Total	570	294	218	7	8	5	3	1	1	2	2	1164

The above classification has been made according to the principles which the writer conceived to govern in alliteration, and which have already been fully stated. He has decided in favor of) classed as double alliteration wherever there were two words in the same half-line or with the same initial sound, if both are of sufficient importance to receive word or sentence accent without doing violence to the sense. This has led him to class as alliterating, 48 words in type a-b-c-d & 3 in type a-e-d, and 2 in a-b-e-d, in the *underer*, *Seafarer*, and *Battle of Maldon*, not marked in Sweet's Anglo-Saxon Reader - the one he has largely used for these three poems. The following are some examples (the additional alliterating word being written purely in italics):
wod winterearig ofer wadema geband. H. 24.
warað hine wræhtast nales wunden gold. H. 32
worlas ða winsalo, waldend licgað. H. 78.
 Hls. 3. 56. 64. 81. 105.
gecunnad in geole gearselda fela. Sea. 5

4. 60. 64

etides in birgum bealostsa hwon. Sea. 28.

tip nichtsena norsan sinude Sea. 31.

Also. 27. 36. 63. 81. 87. 88.

iganto handum, and hige godum. Br. 4.

hwile se he mid handum healdan michte. Br. 14.

stod on stæse, stælice clýpode. Br. 25.

Also 2. 11. ~~22~~ 23. 43. 59. 66. 89. 90. etc.

The Metrical Analysis of the
Vandenberg, Seafarer, Exodus, and Battle of Maldon.

We have selected these poems for analysis for several reasons. In the first place, chronologically they cover nearly the whole Anglo Saxon poetic period. The Exodus is attributed by Stopford Brooke* to the latter part of the 7th or the first part of the 8th century; Müller thinks that the Vandenberg and Seafarer were written in the 8th (Brooke puts them in the first quarter of the 8th); while the date of the Battle of Maldon is fixed by the Anglo Saxon Chronicle itself in the last decade of the 10th. The Paris manuscript gives the date of the battle as 991; the Laud manuscript, and the Canterbury manuscript in the Cottonian collection, give as 991. The poem was written by an eyewitness, and in all probability immediately after the battle, inasmuch as the poet does not seem to have learned the names of any of the enemies. In his "English Literature from the beginning to the Norman conquest."

66
my even their leaders.

Another reason for selecting these poems for analysis is that the three ^{poems} ~~poets~~ Wanderer, ^{the} Seafarer, and ^{the} Battle of Maldon - are texts given in most of the Anglo Saxon readers; and the student who wishes ^{to} can thus verify the results for himself from his own text. It will at least acquaint him with the ^{scientific} method of the study of Anglo Saxon metre.

A third ~~and more important~~ ^{more important} reason for this selection is, that the ~~more important~~ ^{already} Anglo Saxon poems have been carefully analyzed by Sievers, Truch, and Crumer; and as the ^{principles upon which the analysis} ~~theories advanced here differ~~ ^{made here, differ} ~~little in essential particulars from~~ ^{the theories} ~~the~~ ^{are} maintained by them, a repetition of their work would ^{be} ~~have been~~ superfluous. Of ~~these~~ ^{the} poems ^{referred to,} Sievers analyzed the Beowulf in his article "Die Rhythm of the Germanic Alliteration"; Truch analyzed the Elene, Juliana, and Crister, in his dissertation, "Metrisches

und Sprachliches zu Wynne's 'Elene,
Juliana und Crist' and Bremer, ^{analyzed} ~~in his~~
~~the Andreas, Guthlac, and Phoenix, together~~
~~assertation, Helms~~
with the ^{three} preceding, in his dissertation
titled 'Metrische und sprachliche Unter-
suchung der altenglischen Gedichte Andreas,
Guthlac, Phoenix, (Elene, Juliana, Crist).
The summary of their results is given
^{briefly} in the table on page - of Chapter

¹¹
The texts used in this discussion are
Grein's 'Bibliothek der angelsächsischen
Poesie' ^(for the standard, Seafarer and Battle of Maldon) and Sweet's 'Anglo-Saxon Reader'.
I have ^(No. 1) ~~accepted~~ ^{used} Sweet's emendations
as a rule, ^{been accepted, very few additional ones have been} ~~but have attempted very few~~
~~attempted~~. It is a practice so easily car-
ried to excess (witness the efforts of some
of the German metrists along this line)
that I ~~thought~~ ^{seemed} it better to ~~build~~ ^{fit} the
metrical scheme to ~~fit~~ the poetry as it has
been transmitted, rather than attempt to
 mould the poetry to fit some preconceived
metrical theory. By giving the same vowel in

the same word different "quantity" (if ~~any~~ such thing as classic quantity is to be accepted at all) ~~in different~~ as may be demanded different connections, and by expanding & contracting inflection endings at measure, we doubtless would be able to derive a very pretty theoretical scheme, wherein it would be of much practical utility in studying Anglo Saxon poetry & we have it, does not appear.

The few emendations ^{ventured on} (~~they~~ ~~which~~ have been noted at the close of the analysis) were only such as were obviously demanded, and were the insertion of the correct form would avoid an unusual variation of the method.

64 (1) Fundamental Type. $\frac{1}{2}x/\frac{1}{2}x||$ 114

This is the most common of all of the five types. of the ~~2022~~²²²⁸ half-lines contained these four poems, no fewer than ~~1150~~¹¹⁵⁰ more than half of the whole number - long here. This number is very nearly evenly divided between the two half-lines, first having ~~583~~⁵⁸², and the second ~~572~~⁵⁶⁸; the individual poems, W. has: $\frac{1}{2}$ (first half) $\frac{1}{2}$ (second half-line) 50, 3 60; Sea. has: a 50, 3 40; Ex. has: a 95, 2 97; Br. has: a 187, 3 171.

The normal Type: one syllable in each thesis.

Total in whole line 101.

This modification of type is not admitted by ~~Sievers~~ Prof. Sievers, as has already been explained in part II, where our reasons likewise for not following this classification have been given in full. There are 38 of the above examples which might ~~possibly~~ be included elsewhere, by underriding the rhythm slightly less smooth. Prof. Sievers would ~~include~~ ^{class} most of these under headed d. We prefer to put them here being convinced that in reciting these verses the Anglo Saxon poet put no secondary stress

the second syllable of the second foot of the
lf-line.

From the above summary, it is apparent
that this type is rare in the second half-
line; it occurs five times as frequently in
first. It occurs most frequently in
Vandrer and Exodus; very rarely in
Seafarer and the Battle of Maldon.

This type, like the preceding, is not admitted by Prof. Sievers, but, as seen by some examples, there are several half-lines that can not be classed anywhere else, if we are ~~any~~ regard to rhythm. It seems to be entirely lacking in the second half-line. Five of the above examples might be classed under other types.

(3185)

We have called this the normal form of type B, because it occurs much more frequently than the form $x' / x' //$. This is true, not only of the four poems treated in this discussion, but ~~also~~ likewise of those analyzed by Sievers, Fruecht, and Bremer, comprising altogether some 10,000^{lines-} and it is ~~probably~~ probably equally true of the whole body of Anglo Saxon poetry.

The type is found most frequently in the second half-line, occurring there almost twice as often as in the first.

In the above classification, there are examples that might be included under other types by changing the interpretation slightly.

Total in both half-lines. 156.

We have designated this as the normal ^{form} ~~type~~ for \bar{c} , ~~instead~~ ^{as} inasmuch as more than half of ^{all} the examples are included under it. There are more than twice as many here ^{as there are} ~~at~~ under the form $\bar{x} - / - \bar{x} //$

It is to be noted that nearly half ~~of~~ ^{of all} these examples are of the form $\bar{x} \bar{x} - / - \bar{x} //$, illustrating the principle already ~~referred~~ ^{mentioned}, that where two ^{primary} metrical accents fall on adjoining syllables, the second of these syllables is frequently - not, indeed, regularly - a light or ~~a~~ ^{port} syllable.

Fourteen of the above examples could possibly be included under other types.

II Two syllables ~~under~~ in second thesis.

D. Fundamental types $\left\{ \begin{array}{l} \frac{1}{1} \frac{1}{1} \frac{1}{1} \times // (\delta') \\ \frac{1}{1} \frac{1}{1} \frac{1}{1} \times // (\delta'') \end{array} \right\}$

A little more than one tenth of the 2200 lines in the four poems belong here. This type is most frequent in the first half-line, occurring there nearly twice as often as in the second. In the individual poems, it ~~occurs~~ is found most frequently in the Seafarer and Exodus. The following numbers give the examples each: W. a. 12 ; 3, 7 ; Sea. a. 15 ; 3, 9 ; Ex. a. 107 ; 2 ; Br. a. 22 ; 3 17 .

Long Lines.

There are in these four poems altogether but ~~fourteen~~^{fourteen} certain long lines. Of these, five are in the Wanderer (111-115); three are in the Seafarer (23^{103, and} and 106-108); and two are in Exodus (411 and 570-572). No long lines are found in the Battle of Maldon.

These 14 lines arrange themselves under the following types:

- A. Normal form $\text{—} \text{X} / \text{—} \text{X} / \text{—} \text{X} //$
 vā cū æs enōttor in mōde W. 111-a. Wel bið þām þe him ære secas. W. 114-2
 $\text{X} / \text{—} \text{X} \text{X} / \text{—} \text{X} \quad \text{—} \text{X} \text{X} \text{X} \text{X} / \text{—} \text{X} / \text{—} \text{X} //$
 bið sē þe his tréowe ~~he~~ ghealdet. W. 112-a.
 $\text{X} \text{X} \text{X} \text{X} / \text{—} \text{X} \quad \text{X} / \text{—} \text{X} //$ Ðær us eall sēo fæstnung stōdes
 in of his brōctum neȝoan. W. 113-a $\text{—} \text{X} \text{X} \text{X} / \text{—} \text{X} / \text{—} \text{X} //$ W. 115-2
 $\text{X} \text{X} / \text{—} \text{X} \text{X} / \text{—} \text{X} //$
 el mid ēlne gefremman. W. 114-a.
 $\text{X} / \text{—} \text{X} \text{X} / \text{—} \text{X} //$
 ofre to fæder in heofenum. W. 115-a.
 $\text{X} \text{X} / \text{—} \text{X} \text{X} / \text{—} \text{X} //$
 mas Ðær stānelifu beotan. Sea. 23-a.
 $\text{X} \text{X} / \text{—} \text{X} \text{X} / \text{—} \text{X} //$ Ðær him stārn mēcraet. Sea. 23-2
 $\text{—} \text{X} / \text{—} \text{X} / \text{—} \text{X} //$
 el bið sē þe him his dȝyhten ne mdrædes. 106-a
 $\text{X} \text{X} \text{X} \text{X} / \text{—} \text{X} \text{X} \text{X} / \text{—} \text{X} //$

We find from the above results that the
 most common type of the long line is *st-st*. the
 second most common is *st-B*, which is the same
 as *st-st*, with an anacrusis.

Allit. should precede ~~is~~ ⁱⁿ ~~is~~ 61. 122 ^{analysis}
~~directions for the metrical~~ ^{structure}
of the normal line.

Prof. Sievers in his article ^{previously referred to} on the
~~Anglo~~ "Rythm of the Anglo Saxon Alliter-
ate Line" in Paul and Braune's Beitrage,
pages 220-222, Vol. X, lays down the
following "fundamental rules for the
structure of the second half-line:-

- The half-line consists of two parts, each
containing an arsis. ~~For~~ ^{For} lack of a better
name, we shall designate ~~each~~ ^{each} of these parts
a "foot."

Both of these feet are either two-syllable~~d~~,
or the one is one-syllable~~d~~, the other three-
syllable~~d~~. A one-syllable~~d~~ foot consists
merely of an arsis; a two-syllable~~d~~ foot
consists of an arsis and a thesis; and a
three-syllable~~d~~ foot, of an arsis ^{and} a two-syl-
lable thesis, one foot of which has a secondary
accent; or, otherwise expressed, of a primary
arsis, a secondary arsis^{*}, and a thesis.

From this it follows that both feet are
to be considered, as a matter of course, as
measures of equal time in the sense of the

~~Directions for the Metrical~~ ^{analysis}
the normal line.

Prof. Sievers in his article ^{previously referred to} "On the Anglo-Saxon Alliterative Line" in Paul and Braune's Beitrage, pages 220-222, Vol. X, lays down the following "fundamental rules for the structure of the second half-line:-

The half-line consists of two parts, each containing an arsis. * For lack of a better name, we shall designate ~~each of~~ these parts "feet."

Both of these feet are either two-syllable, the one is one-syllable, the other three-syllable. A one-syllable foot consists of an arsis; a two-syllable foot consists of an arsis and a thesis; and a three-syllable foot, of an arsis ^{and} a two-syllable thesis, one foot of which has a secondary arsis, or, otherwise expressed, of a primary arsis, a secondary arsis*, and a thesis.

From this it follows that both feet are to be considered, as a matter of course, as measures of equal time in the sense of the

The objection to this term has been given on a previous page.

hyme-verse. Equal duration of the feet
can be admitted in general only of those
verses which consist of two-syllable feet.
the Case of those formed after the scheme
3 syllable, or 3+1, the greater expansion
of the one foot is made compensation for
shortening of the other.

The two syllable feet are either falling (tro-^{in rhythm}-
chee), or rising (iambic); the ~~two~~ ^{three} syllable feet
are only falling with a secondary accent
on the second or third syllable. Rising and
falling types can be united with one another
interchange at pleasure, it being presumed
that the whole ^{half-verse} verse will not become longer
than four syllables. (compare number 2). Only in
first ~~half~~ ^{the half-line} time do we find ~~it~~ ^{the half-line} expanded
to greater length (2+3 and 3+2).

The stress ^{apex} ~~fall~~, as a rule, ~~is on~~ ^{is on} the ~~the~~ ^a syl-
lable having ~~the~~ primary accent; more rarely
on heavy suffixes, or ending-syllables.

The bearer of the accent can be, in gener-
al, only a long syllable, or the resolution of
into ~~XX~~ ^{XX} ~~XX~~ ^{XX} the Case of two accented
syllables coming together (also in the case of a
primary and ^a secondary accent) can the second

accented syllable be shortened to i.

The theses are completed mostly through affixes and ending syllables; also through velitic and proclitic words; but only exceptionally by ~~not~~ ^{the} members of compound words. (~~which~~ ^{of these}; however, must not ^{such} take a principal accent.) Moreover, ~~the~~ ^{compounds in the thesis,} ~~there~~, as a rule, in turn exercise a marked influence on the following arsis.

The closing thesis of every half-line ~~ending~~ ^{which} ends with a thesis, must be monosyllabic. The middle thesis, in whatever type, is mostly monosyllabic; very often it has two syllables, ^{or} rarely more. The initial thesis of a rising initial verse usually has from 1 to 3 syllables, ^{or} rarely more.

Real anacruses before otherwise completed ^{verse} (of four and five syllables) appear only in exceptions.

(Skip three lines or spaces)

As has already been noted, we do not follow ~~him~~ ^{him} altogether in all of the above rules, especially number 3 and number 8. ^{or} reasons for differing with him in the former case have already been given* ~~those~~

~~for the latter will be given below.~~

and it is unnecessary to repeat them. They are based on our conception of the requirements of all poetic rhythm - Anglo-Saxon included.

Prof. Sievers has gone to great lengths in his endeavour to restrict the closing thesis of each half-line within the limits he has set. He has been compelled to change grammatical forms, to substitute in many places an English dialect for the West Saxon, ~~in many places~~ to give the same ^{syllable a different} ~~word~~ ^{sometimes} "quantity" in different metrical connections, and to disregard ordinary rhythmical requirements. It is doubtful if the results have been worth the effort; it makes little difference in the historical development of English metre whether ~~or not~~, ~~Sievers contends that~~ ~~whether the Anglo-Saxon~~ Sievers' contention that "only one syllable is admitted in the closing thesis of a half-line" ~~is~~ ^{be} true or not. He himself admits that it is not true of the West Saxon dialect - the dialect in which the principal poems are transmitted - and it cer-

Of great many other ^{similar} examples might be
~~ited~~ quoted, but the above are sufficient.
In the Wanderer, Seafarer, and Exodus
alone there are 101 half-lines at least
in which the rhythm seems ~~to~~ to demand
that they be classed under type A, with two
syllables in the closing thesis. Of these, 88
are in the first half-line, and only 13 in
the second. This proportion indicates
that is true generally: the two-syllable
closing-thesis is very rare in the second
half-line.

We have cited no examples from the ~~Book of~~
~~of Malden~~,
as much as Prof. Sievers
admits the occurrence of two-syllable
closing-theses in the later poems. It is inter-
esting to note in this connection however, that
of the 646 half-lines of ^{the Battle of Maldon} ~~this poem~~, we have
classed only 35 half-lines under this type,
making about $5\frac{1}{2}\%$. While of the 1582
half-lines of the other three poems, there
are 101 under this type, making 7% -
showing thus a greater proportion
under the earlier poems.

As to whether we have examples of two
syllables in the closing-thesis under *c*,
is a doubtful question. If we have, these
syllables, from the very nature of the rhythm
after *c*, must be very light and easily
pronounced. They must be such that they
can be pronounced in connection with the
preceding arsis in the normal time of
the arsis, otherwise they will change the
character of the rhythm from the
ascending to the descending, and so
change the type from *c*, to something else.

The following are examples:

De dē dāncige. Br. 173.

$\times \quad \overset{\cdot}{-} / \quad \overset{\cdot}{-} \quad \times \quad \times //$

rom wāt sē se seall W. 3.7.

ðær bāldicost

$\overset{\cdot}{-} / \quad \overset{\cdot}{-} \quad \times \quad \times //$ Br. 78.

to m lōcias Ex. 278.

$\times \quad \overset{\cdot}{-} / \quad \overset{\cdot}{-} \quad \times \quad \times //$

ne sýn godes ðeodscipes Ex. 528.

$\times \quad \times \quad \overset{\cdot}{-} \quad \overset{\cdot}{-} / \quad \overset{\cdot}{-} \quad \times \quad \times //$

ā mæg gnórnian

$\times \quad \overset{\cdot}{-} / \quad \overset{\cdot}{-} \quad \times \quad \times //$ Br. 315.

By using anacrusis, these, and similar

examples would fall under type D, and perhaps the argument as a whole is in favor of placing them there, although a crisis is to be avoided, unless demanded by the rhythm.

~~rules for the metrical analysis of the normal line.~~ The structure of the normal line.

Every complete normal line is composed of two half-lines. ^{These are of} ~~of~~ equal length or measure, though this period of time may be occupied by a different number of sounds (even pauses) in each half-line. The division between the two half-lines is marked the caesural pause, which falls uniformly at the metrical center of the normal line. It must coincide with a logical pause, and must not separate words that are joined by very close syntactical relation.

Each half-line of every normal line contains, and only two, feet, or measures. Each foot must contain one, and only one, primary metrical accent. The part of the foot which takes the metrical accent is called the arsis. Feet ^{usually consist of an arsis} ~~are divided into two classes, one which consist of an arsis alone, and~~

those in which the arsis is accompa-
ned by ^{and} an unaccented syllable, or syllable
called the thesis. There are feet
which consist of an arsis only.

The feet in the same half-line are
approximately ^(and usually do) equal in length in
recitation, although they may consist
of an unequal number of sounds. The
number of sounds or syllables in a foot
may range ^(under certain limitations) from one to perhaps half a
dozen. In the latter case it is essential
that ^{they} ~~the~~ syllables be light, ~~unemphatic~~ ^{unemphatic},
and easily pronounced, otherwise the
verse ~~the verse~~ ^{the effect} will have a heavy, drag-
ging appearance. If ~~the~~ ^a foot is mono-
syllabic, the lack of a thesis is supplied
by a pause. The other foot then in the
half-line will regularly contain ~~the~~ a
thesis of two syllables, the first of
which generally has a secondary
word-accent.

Feet are ^{classified as} either falling or rising, ac-
cordingly as the accented or the un-
accented part comes first. Feet of the

elling type are much the more numerous
in Anglo Saxon poetry.

The arsis is the accented part of the
foot. It usually consists of the important
syllable of an important word in the
half-line. It always takes the metrical
accent, and must have besides, either

a word-accent, or a sentence-accent, or
both. ~~The second part of a compound with a strong secondary
accent may serve as an arsis.~~ It usually consists of the principal

syllable of a leading part of speech,
but it may consist of an adverb, a
preposition, or even a conjunction, if this

has a strong sentence-accent. The second
part of a compound with a strong secondary accent may serve
as the arsis. ~~The arsis~~ is usually "long" in quantity.

~~where~~ ~~if it is~~ not "long" in the classic
sense, the accent falling on it causes it

to be held longer than ~~the~~ a syllable in
the adjoining thesis. Most frequently,

however, the syllable comprising the
thesis is "long" also in the classic sense, ~~that is, it~~

~~contains~~ contains a long vowel or diph-
thong, or it is followed by two conso-

nants in the same syllable. The principal

exception to this, is when the syllable immediately preceding has an accent - either rhythmical accent (as in types C), ~~and D~~, or a secondary word accent (as in compounds etc., in type A); then the syllable constituting the arsis is frequently a light or "short" syllable. This ^{is} doubtless ~~is~~ in the way of compensation for the previous heavy syllable, the "short" syllable being more easily articulated in that connection than another long one would be. Sometimes instead of a ^{single} long syllable constituting the arsis, there are two "short" or light syllables. This is called the "resolution of the arsis". In this case the first of these syllables takes the stress of the accent, and the second is joined to it as an ~~enclitic~~ ^{enclitic}. Both together are pronounced in the time of an ordinary arsis.

The thesis normally consists entirely of unaccented syllables - one or more. The usual number is from 1 to 3; these ~~if~~ ^{if} a greater number of syllables than 3 are rare. The number of theses which a poet may have is restricted to some ex-

75 136

ent by the verse-type to which the foot
belongs. In type A, the closing thesis
of the half-line ~~may~~^{is} ~~can~~ not permitted
more than two syllables; the closing thesis
be rarely, if ever has more than
one syllable. ~~These~~ Theses beginning a verse
have a greater fondness ~~more than any others~~ than any others
in a half-line. ~~theses~~ The syllables of
the theses are not ~~necessary~~ ~~not~~ necessari
"short" in the classic sense; they may
be "long" as well as ~~not~~. The chief require-
ment is that they do not take a sentence-
accent or a metrical accent. Sometimes
in types D and E) the first syllable of
thesis of two syllables may take a
secondary word accent - the accent upon
second part of a compound word - but
it must be ^{carefully} distinguished from a sentence
metrical accent. The first thesis in the second half-line
~~alliteration is the key-note to the~~
always the first word that alliterates
~~in versification. In the second half~~
~~the first alliterative~~
~~that line half-line. and every alliterating~~
~~word is placed~~
~~in the first foot of that half-~~
~~line in either half-line represents an~~

16-13

arsis. ~~the~~ Only words that are im-
portant in the line - words that take
a sentence accent, or a word accent,
or both - can be considered as
alliterating.

Anacrusis may occur with any-half
line that commences with a descending
measure. It performs no rhythmic
function, however, and is to be avoided
in analyzing the metrical structure
whenever possible.

Rules for the metrical analysis of the
~~the~~ normal line:

1. # Fix the arses by means of the allit-
erating words (beginning with the second half-
line) the sentence accents, and the word
accents.

Be guided by the ^{ordinary} principles of
rhythm in classifying the types.

Prefer ~~regula~~ simple and regular
types; repeat when possible types
that have occurred in neighboring lines.
Emphasize, ~~where possible~~, the thought

by means of the verse type; do not sacrifice sense to sound; let the thought determine the sentence, accent; avoid anacruses, unless actually necessary.

Represent as syllables in the verse type the consonants l, n, and r, in all words which they are pronounced as ^{separate} syllables.

Remember that Anglo Saxon ^{versifi-} poetry is "accentual", and that quantity here has the same definition as in modern English, rather than that of the Latin and Greek.

The Anglo Saxon Long Line, or Ex- ameter

In addition to the Anglo Saxon
normal line of four feet, there are
met with ^{in Anglo Saxon poetry} between four and five hun-
dred long lines, or "expanded lines", ~~these~~
~~containing~~ six feet each. These long lines
~~are met with~~ are right generally distributed through-
out the ~~poetry~~, ~~there~~ the principal ~~poems~~
not containing any being the Juliana,
the Battle of Maldon, and the ^{West Saxon} translation
of the Psalms. They occur ~~both in~~ most
~~It is not always easy to distinguish~~
~~commonly in groups, but are also found~~
~~long lines of from the normal lines~~
now and then ^{occurring} singly in the midst of nor-
mal lines. Likewise single normal lines are
sometimes found in a group of long lines.
~~Whether a normal half line and a long~~
~~half line can be united into a whole line~~
is still an unsettled question*. The rhythmic
requirements ^{would} argue against it.

Schipper in his "Englische Metrik" ^(page 48) takes the
position that they can, but the examples he cites are
~~not conclusive~~ hardly conclusive.

It is sometimes difficult to distinguish between a long line and a normal line with anacrusis, or with an expanded thesis. Especially is this the case where the long line occurs isolated in the midst of short lines. Perhaps the best way to treat such lines is to make them conform to the metrical types of the surrounding lines if it can be effected ~~and~~ without doing violence to metrical principles; ^{it is not probable that the Anglo-Saxon poet,} the "rhythmic impulse" as well ^{than the modern English poet, would charge for a single line} as the nature of the thought, should also ~~from two iambus to three iambus~~ ^{the character of his rhythm, without good reason.} Considered in classifying such lines. ~~(over)~~

The chief formal difference between a normal line and the long line is the difference in the number of feet; the normal line contains four, the long line six feet. But the rhythmical difference is much more considerable than could be indicated by this. In the rhythm of most of the long lines, we have something altogether different from that of the normal line. We have

* As a rule the long lines ^{are} ~~seem to be~~ used
where a stately, ~~formal~~ ^{majestic} movement seems
to be demanded.

at least,
 a rhythm which, in some cases, approach
 very nearly our modern English dactylic
 hexameter. This will be perceived
 from a comparison of the following
 lines:—

ofer seoda gehwylce: Eal ðu hit gebyldum healdest
 x x / — x x / — x // x x x x / — x / — x //
 travelling the vale with mine eyes—green meadows and lake with green
 egeu mid modes snigtrum. Le se seal mine gelaestan
 x x / — x / — x // x x x x / — x x / — x
 in its basin of rock; and the stream flowing in brightness
 tode swa wit furðum spræcau: su sealt to frofre neorðan
 x x x / — x / — x // — x x x / — x / — x //
 filled with beauty and love in the wooded slope of the mountain,
 we think it will be evident to anyone
 who reads these lines properly, that there is a sim-
 ilar largeness and sweep about the movement
 of the rhythm, that is very striking. But
 while these rhythms here are very like each
 other, it is to be remarked that they are both entirely unlike the Latin
 Greek dactylic hexameter.

There are two theories of the structure
 of this long line. Sievers[†] suggested in his article in
~~Land and Brainerd's~~ ^{in his article in} ~~Antiquary~~ ^{that}
 consists of ~~an~~ ^{an} ordinary type with
 x.../v...x — / x prefixed. While Dr. Quirk
 Paul, and Brainerd's ^{vol. XIII} ~~Antiquary~~ proposes the

...which, in some cases, approach
very nearly our modern English dactylic hexameter. This will be perceived
from a comparison of the following lines:-

ofer seoda gehwylce : eal ðu hit gebyldum healdest
X X / - X X / - X // * Y X X / - X / - X //
travelling the vale with mine eyes - green meadows and lake with green
regen mid modes snigtrum. Le ðe secal mine gelaestan island
X X / - X / - X // X Y X / - X X / - X
in its basin of rock; and the stream flowing in brightness
toðe swa wit furðum spracean, ðu sealt to frofre neorðan
X X X / - X / - X // + X X / - X / - X //
filled with beauty and love in the wooded slope of the mountain,

We think it will be evident to anyone
who reads these lines properly, that there is a sim-
ilar largeness and sweep about the movement
of the rhythm, that is very striking. But
while these rhythms here are very like each
other, it is to be remarked that they are
both entirely unlike the Latin
Greek hexameter.

There are two theories of the structure
of this long line. Sievers[†] suggested that
it consists of ~~an~~ an ordinary type with
X.../v...X - / * prefixed. (While Dr. Quirk
Paul and Braune's Beutrag^{vol XIII}) proposes the
view that it is the result of molding together
ordinary types, with the result that

Beutrag 106-111
J.D. Campbell
1908

for regularly ~~second~~ ¹⁴⁷⁸ completed, there is added to it one
with the first word a continuation follows as
of the ~~regular~~ five regular types.
But ~~not~~ the first word of one of the five
types. ¹⁰⁷ The latter view is rather more

probable, and as it explains all the
phenomena, and gives an intelligible basis
for naming the types, we have adopted
it here.

Alliteration in the long line.

Alliteration is more abundant
in the long ^{lines}, ~~as a rule~~, than in the normal
line. Two alliterating words in the first
half-line are the rule, and sometimes
we find even three; as

man to ðam gylðnan gylde: ðe he him to gode geteod. Dan. 204.

eorfon ða hæsenan hæftas: fram ðam halgan crihton. Dan. 262.

With double alliteration in the first line
usually falls on the first and second
arises, as

to ðæder on heofnum: ðær us eall seofraetung stendas. W. 115.

~~These are~~ ^{examples} the second and third arses have
alliteration; as

ærom hyra raedas rice: siððan he rōdera wīldend. Dan. 457.

There ~~are possibly examples of~~ ^{are possibly examples of}
~~to me~~ alliteration in the first
and third arses, if we include as long lines such
the following from the "Rhyme & Poem":

~~the regular five regular types.~~
~~But more the first of one of the five~~
types. ^{10P} The latter view is rather more

probable, and as it explains all the
phenomena, and gives an intelligible basis
in naming the types, we have adopted
it here.

Alliteration in the long line.
Alliteration is more abundant
in the long ^{lines}, as a rule, than in the normal
line. Two alliterating words in the first
half-line are the rule, and sometimes
we find even three; as

man to ðam gylðnan gylde: ðe he him to gode geteod. Dan. 204.
eorfon oð hæðenan hæftas: fram ðam halgan enihton. Dan. 262.

With double alliteration in the first line
usually falls on the first and second
arises, as

tofre to gæder in heofonum: ðaervus eall se of facetmunga stoidas. 11. 115.

~~are rarely~~ the second and third arises have
alliteration; as

ærom hyra raedas rice: siððan he rōdera waldend. Dan. 457.

There ~~are possibly examples of~~ ^{are possibly examples of}
~~to me line with~~ alliteration in the first
and third arises, if we include as long lines such
the following from the "Rhymed Poem":
tamas suā hep gedreosa: dnyhtscype gehreosa. Reiml. 55.
her men forreosa: leahtras oft gecorad. Reiml. 56.

ch lines, however, can perhaps be better ana-
lyzed as normal lines with expanded theses;
the connection and the thought do not sug-
gest the majestic movement of the long
line.

There are rare examples of single allit-
eration in the first half line; in this
case the alliteration usually falls on the
second arsis, as

me sūa lōht oðiflā; and mine lēde genēde. El. 163.

In the second half-line ~~the rule is sin-~~
gle alliteration ~~is~~ the rule, and that
falls regularly upon the second arsis, as

~~þā hī sē oð him his ðryhtne ondræde~~

þā hī sē oð eāmonð lōfas; cymes him sē araf heofonum. Gen. 107.

There are two exceptions with alliteration
in the second half-line in *Gr. Ex.* as

þan sceal mæn strangan mōde; storm of holm gebringeð. Gen. Ex. 51.

Here we have double alliteration in

the second half-line, which falls then either
on the first and second, arses; or on as,

ā eudeo anōttor m mōde; geðæt him sūndor aet rīne. H. III
adoreynings word; geuotan ðā ðā wītigan oð. And. 801;

on the second and third arses, as
as him sūeg to sorge; ðan mā ðe sūnnan sēma. Ex. Dan. 26.11.

the types.

As already remarked, the types of the long lines can best be explained as resulting from the contraction of two of the normal types. - the second type ^(sometimes minus an initial thesis) following immediately after the first ^{apart from} of the first types. In the long lines transmitted to us the following types are represented :-

Type A-A. $\acute{x} \dots \acute{x} \cdot \acute{x} \cdot \acute{x} //$ *

~~Crinne wis gōt gesomrod. Gen. 10/18.~~

$\acute{x} / \acute{x} / \acute{x} / \acute{x} //$
feorh of feonda dome. Ex. 570-a.

$\acute{x} / \acute{x} / \acute{x} / \acute{x} //$
Eder ōn ōlades siððan Ev. 14/10-2.

Type A-B. $\acute{x} \dots \acute{x} \cdot \acute{x} \cdot \acute{x} //$

waesce his wārig hraegl. Gen. Ex. 99.
 $\acute{x} / \acute{x} / \acute{x} / \acute{x} //$

Type A-C. $\acute{x} \dots \acute{x} \cdot \acute{x} \cdot \acute{x} //$

wæge to wōruldmytthe. Gen. 10/16.
 $\acute{x} / \acute{x} / \acute{x} / \acute{x} //$

Type A-D. $\acute{x} \dots \acute{x} \cdot \acute{x} \cdot \acute{x} //$

kelde byrnwiggende. Jud. 17-a.
 $\acute{x} / \acute{x} / \acute{x} / \acute{x} //$

Type A-E. $\acute{x} \dots \acute{x} \cdot \acute{x} \cdot \acute{x} //$

sweord and swatigne helme. Jud. 338.
 $\acute{x} / \acute{x} / \acute{x} / \acute{x} //$

The dots in the metrical scheme represent the ^{highest} number of additional syllables that in the thesis that occur.

Type

B-A. $x - x \dots / - x / - x //$

ālaetan lēas-gānga. Dan. 263.

 $x - x / - x / - x //$

This type is thus given by Sievers.

a ~~metrical~~ ^{requirements of the rhythm} ~~requirements~~ would rather
take ~~it under~~ such examples under
be ~~at~~ with A-A, with anacrusis.Type B-B. $x - / \dots x - / \cdot x - //$

ta gervāt sē engel tīp. Dan. 441.

 $x x - / x - / x - //$ Type B-b. $\dots x - / \dots x - / - x //$

and makte ealdfeondum. Dan. 454.

 $x - x - / - x //$ Type B-D. $\dots x - / \cdot x - / - \geq x //$

on cōrsan inswāestene. Jud. 65.

 $x - / x - / - \geq x //$

This is according to Sievers' classi-

fication. Here again the rhythmic require-
ments would be better met, by ~~classing~~ ^{treating}
these examples with anacrusis, and
classing them under A-D.Type B-E. $x - \cdot \dots / - \geq x / - //$

searf he by eðleane gefōr. Gen. 1523.

 $x - x x / - \geq x / x - //$

Here also we can improve the rhythm of

the metrical scheme by using anacrusis
 the first ~~short~~ syllable is always short
 and unimportant, ^{anyway} and classing the ex-
 amples under A-E.

Type C-A. $x \text{---} / \text{---} x \cdot / \text{---} x //$
~~trúty sac hein lánides. Gen. 2854.~~
~~geþeoð sórga máste. Gen. 1209.~~
 $x \text{---} / \text{---} x / \text{---} x //$

C-B. $x \text{---} / \text{---} / \text{---} x //$
 ne se brýne beotmáecgum. Dan. 265.
 $x \cdot x \cdot x \cdot x / \text{---} / \text{---} x$

The rhythmic scheme
 of the examples which Sievers quotes
 here, is really this: ... $x \text{---} / \text{---} \dot{\text{---}} x //$ that is,
 with the second foot of C, and the first foot
 of D, omitted.

Type C-D. $xx \text{---} / \text{---} / \text{---} \dot{\text{---}} x //$
 Oðr he syðer fole sámríde. Dan. 228-3.
 $x \cdot x \cdot x \cdot x / \text{---} / \text{---} \dot{\text{---}} x //$

Type C-E. $x \text{---} / \text{---} \dot{\text{---}} x / \text{---} //$
 forðon wærlōzma sint. Gen. 2404-3.
 $x \text{---} / \text{---} x \cdot x \cdot x / \text{---} //$

In the above types we have given
 only the normal or at least the simplest
 form. In each case ~~we have~~ ^{occur} the various

modifications that were met with in the
~~discussion of the~~
~~over the~~ normal types of the normal
 e; anacrusis, the resolution of arses,
 increased number of syllables in the thi-
 is, etc. The last-mentioned variation
~~types~~ attains its maximum in A-A,
 where we have ^{as many as} five syllables in the
 thesis, as

lól 'bī sē oē him his dýhten ne ondráedes.
 ˘ x x x x x / ˘ x x x / ˘ x // Sea. 106.

Of the types given above, A-A is
 by far the most common. Sievers, in his
 "Altgermanische Metrik" gives the follow-
 ing figures for a total of 848 lines
 analyzed: A-A. (all forms) ~~565~~ 565*. A-B,
 A-C, 26. A-D, 12. A-E, 20. B-A, 121. B-B, 9.
 B, 8. B-D, 16. B-E, 3. C-A, 15. C-B, 9.
 D, 2(?) C-E, 1(?).

The fact that so nearly all of the
 samples belong to type A-A, doubtless
 suggested to Sievers the theory that the

(with anacrusis)
 Were B-A. classed here, as the rhythm seems to
 require, this number would be increased to
 6 - leaving only 162 examples of all other types.

long is formed by prefixing $\frac{1}{2}x \dots$
the normal types.

Lines longer than ~~1~~ six feet.
Prof. Silvers thinks that we have
perhaps a few examples of lines of
eight feet ~~or~~ at least, half-lines of four feet, as
call him *primus blödige Sichtung*. Ex 572.
Engel in *Donne ofn innar beirinn*. Dan. 238.
Eldon *Sact englas dýktur* call K. 9.
He also suggests that some of the longer
lines ~~usually~~ classed by him among the
half-lines containing but three feet, ~~that~~
could possibly be included here.
However, since these examples ~~by means~~
~~since~~ are so rare, ~~and inasmuch as~~
~~anacrusis~~ few, and ~~since~~ they can
~~all~~ all, by means of anacrusis ~~or~~
undid thesis, be ~~included~~ ^{scanned} as ordinary
long lines, it seems to us unnecessary
to make another class. Besides in
every case cited, the other half-line has
only three feet, and the rhythmic

requirements would argue against
 taking ^{here} a half-line ~~here~~ of four feet. We
 certainly have no more reason, if as
 much, for supposing that the poet
 could ^{pooner thus} destroy the balance of the
 poem of his ^{long} line in this case than
 we would in the case of the normal
 line by uniting a two-foot half-line with a three-foot half-line.
 Both are rhythmical improbabilities, and can
 be admitted only on ^{unmistakable} proof.

150 a. ~~by flat two pages.~~
actual emendations. right after typed.

feh, Br. 39-a, should probably have the
long diphthong ^{feh}, giving the metrical scheme '-x/-x//
instead of '-x/-x// which is found nowhere
else.

heles, Ex. 48, should be changed to the more
common form, haelesas, for a similar reason.

gfraege, Ex. 368-b, and gfraegost, Ex. 394-b,
if written long, gfraege and gfraegost,
will avoid giving a variation found nowhere
else of the normal type.

feor, Ex. 1-a, should give place to feorr, the
regular form.

moni, Br. 239-a, is for the regular form monige.

flat, Br. 41-a, should be replaced by flote,
the regular form of the dative case.

~~righticestum, Ex. 85-a~~

habas, Ex. 1-b, should be changed to the reg-
ular form habbas.

men ^{Ex. 373,} should be written menn to avoid
occurrence of an unusual variation
of the normal type.

167 (B)
swippode, Ex. 463-3, should probably be
swippode.

bodigean, Ex. 510-a, should be changed to
either bodian, or bodigan, the ordinary
forms.

cyn, Ex. 265-3, should be the full form cynn.

God, Ex 432-3, 94-3, and Br. 262-3, will
avoid an unusual ^{variation} (perhaps occurring in
or other place) ~~variation~~ if changed to
od. The metre suggests this as the
correct quantity of the word, anyway. Of all
the occurrences in these four poems,
every case, with one or two exceptions,
a long quantity would class ^{its} ~~the~~ half
under a much more common verse
type.

Alliteration.

Numbering the feet a, b, c, d, in the order in which they occur in the line, we have the following types of alliteration, in these four poems: a-b-a, occurring 570 times; a-a, 294 times; b-a, 218 times; a-a-b, 4 times; -b-a-b, 8 times; b-a-b, 5 times; a-b-b, 1 times; a-b, 1 time; b-b, 1 time. We have "crossed" alliteration of the type {a-a} {b-b}, two times; and of the form {a-b} {b-a} two times.

We see from these figures that there are only three very common types of alliteration, a-b-a, a-a, and b-a. Of these the first is much the most common, the second is next most ^{common} frequent in the earlier poems, but the third in the latest poem. The ~~percent~~ ^{percent} of the Wanderer, Seafarer and Battle of Maldon under a-a is about 28. of Battle of Maldon, about 22. The percent of the first three poems under b-a is about 15. of Battle of Maldon, about 30. This seems to indicate that the latter

the of alliteration given in favor in the later period.
~~Alliteration.~~

Tabular Summary.

type	Wanderer	Seafarer	Prologue	Battle of Maldon	Battle of Merton
